Deploying IP Multicast in the Enterprise Thomas Maufer, 1998 All readers need to know to deploy IP Multicasting now and optimize it tomorrow is found within these pages This is one of the first books to closely examine the protocols which make Multicasting possible and the thorny routing issues that arise in enterprise Multicasting

Definitive MPLS Network Designs Jim Guichard, François Le Faucheur, Jean-Philippe Vasseur, 2005-03-14 Field proven MPLS designs covering MPLS VPNs pseudowire QoS traffic engineering IPv6 network recovery and multicast Understand technology applications in various service provider and enterprise topologies via detailed design studies Benefit from the authors vast experience in MPLS network deployment and protocol design Visualize real world solutions through clear detailed illustrations Design studies cover various operator profiles including an interexchange carrier IXC a national telco deploying a multiservice backbone carrying Internet and IP VPN services as well as national telephony traffic an international service provider with many POPs all around the globe and a large enterprise relying on Layer 3 VPN services to control communications within and across subsidiaries Design studies are thoroughly explained through detailed text sample configurations and network diagrams

Definitive MPLS Network Designs provides examples of how to combine key technologies at the heart of IP MPLS networks Techniques are presented through a set of comprehensive design studies Each design study is based on characteristics and objectives common to a given profile of network operators having deployed MPLS and discusses all the corresponding design aspects The book starts with a technology refresher for each of the technologies involved in the design studies Next a series of design studies is presented each based on a specific hypothetical network representative of service provider and enterprise networks running MPLS Each design study chapter delivers four elements They open with a description of the network environment including the set of supported services the network topology the POP structure the transmission facilities the basic IP routing design and possible constraints Then the chapters present design objectives such as optimizing bandwidth usage Following these are details of all aspects of the network design covering VPN QoS TE network recovery and where applicable multicast IPv6 and pseudowire The chapters conclude with a summary of the lessons that can be drawn from the design study so that all types of service providers and large enterprise MPLS architects can adapt aspects of the design solution to their unique network environment and objectives

Although network architects have many resources for seeking information on the concepts and protocols involved with MPLS there is no single resource that illustrates how to design a network that optimizes their benefits for a specific operating environment The variety of network environments and requirements makes it difficult to provide a one size fits all design recommendation

Definitive MPLS Network Designs fills this void This book comes as a boon to professionals who want to understand the power of MPLS and make full use of it

Label Assignment and Failure Recovery Approaches for IP Multicast Communication in MPLS Networks Omar Qasem Banimelhem, 2005 Multiprotocol Label Switching MPLS is an Internet Engineering Task Force IETF framework that provides for the efficient designation routing forwarding and switching of traffic flows through the network MPLS is widely used for multicast traffic engineering However integrating MPLS with IP multicast

communication is difficult This thesis proposes solutions for two problems label assignment and failure recovery When a set of multicast flows sessions is deployed in an MPLS network each multicast entry for the sessions consumes an MPLS label However MPLS labels are significant resources in MPLS networks as the 20 bit field of the MPLS header limits the number of available labels It is advantageous if different multicast sessions can share the same multicast tree in the network and re use the MPLS label In the first part of the thesis we propose two algorithms to do this The first one is called State Encoding SE in which a code is calculated for every tree built in an MPLS network The second algorithm is called Tree Numbering TN where a number represents each tree If the IP packets of different multicast sessions are delivered over the same tree all those packets are then classified to the same Forwarding Equivalence Class FEC and only one label is used instead of using a number of labels equal to the number of those sessions The second part of this thesis contributes to this area To trade off between the large amount of bandwidth required for reserving backup paths in local recovery and the large recovery time taken in global recovery a new tree division approach is proposed In this approach a multicast tree is divided into several domains where each domain represents a local stand alone sub tree of the original one Two MPLS based methods are then proposed to set up the backup paths inside the domains A comparison is made among the local recovery approach the global recovery approach a method that sets up the backup paths between the branching points and the proposed approach The comparison is based on three metrics the total backup capacity the maximum and the average notification times and the average number of the notification messages that are produced as a result of a failure In terms of the reserved capacity the results have shown that our architecture consumes backup capacity close to that consumed by the global recovery

A Primer of Multicast Routing Eric Rosenberg, 2012-01-18 Whereas unicast routing determines a path from one source node to one destination node multicast routing determines a path from one source to many destinations or from many sources to many destinations We survey multicast routing methods for when the set of destinations is static and for when it is dynamic While most of the methods we review are tree based some non tree methods are also discussed We survey results on the shape of multicast trees delay constrained multicast routing aggregation of multicast traffic inter domain multicast and multicast virtual private networks We focus on basic algorithmic principles and mathematical models rather than implementation level protocol details Many historically important methods even if not currently used are reviewed to give perspective on the evolution of multicast routing
