Abstract — This short paper presents an overview of the potential of RF Waveform Measurement and Engineering to support the developments of transistors, circuits and systems that rely on strong non-linear effects. To date these concepts have mainly been focused towards aiding the development of RF Power Amplifiers (RFPAs). This is because the performance of RFPAs both exploits (efficiency) and is limited (linearity) by strongly non-linear effects. RFPAs are a critical component in many systems; e.g. mobile communications, satellite communications and radar systems.

I. INTRODUCTION

RF Power Amplifier (RFPAs) performance, output power, conversion efficiency and linearity, etc., is influenced by the transistor terminal voltage and current time varying waveforms. Thus *waveform engineering* should be driving the RFPAs design process at all levels; transistor optimization, circuit design and system requirements. In practical RFPAs design, waveform engineering is only a guiding principle; its direct application previously hindered by the lack of appropriate RF waveform measurements tools. The past 15 years has seen the maturing of RF voltage and current waveforms measurement systems. Coupling with impedance control hardware also enables experimental control (Engineering) of these terminal RF waveforms during measurements; thus providing a *practical RF Waveform Measurement & Engineering solution*. Application involves either the direct utilization of the measurement system in the design investigation/evaluation loop, or its indirect use by providing CAD accessible datasets or behavioral model parameters.

II. RF WAVEFORM MEASUREMENT

The most utilized microwave measurement tools supporting CAD design measure *s*-parameters, small signal parameters, are only of limited use in non-linear CAD design. Non-linear CAD design must include mixing (intermodulation distortion), compression (harmonic generation), etc. While this information, ideal for system evaluation, is provided by (Vector) Spectrum Analyzer and/or Power Meter; in this form it is again of limited use in non-linear CAD design. This

explains the prevalence of “build and test” in the RFPAs design cycle.

Initially RF Waveform Measurement capability was realized by integrating sampling scopes within conventional *s*-parameter measurement systems [1]. The Microwave Transition Analyzer (MTA) triggered the realization of standalone RF Waveform Measurement Systems [2]. Figure 1 shows the standard, full two-port, architecture of RF Waveform Measurement Systems, often referred to as a Non-Linear

Fig. 1 Basic schematic of an RF Waveform Measurement and Engineering System [3].

Vector Network analyzer (NLVNA) now typically employed [1]. Presently receivers employed include four channel digital sampling scopes (i.e. Tektronix DSA + Meso M20), sampling down converters or 5 channel network analyzers (i.e. Agilent PNA-X). All systems are fully vector calibrated and provide for error
