## Variable steering concept with "active rear-axle steering"

Axis 1, 2 and 3 set up as "active rear-axle steering". 3 steering methods are selectable by four programs (P).

### P1 Reverse steering

Axis 1 and 2 are steered automatically with the assistance of the steering wheel. Axis 3, 4 and 5 are steered "active" speed dependent according to the steering of the main axis, and vice versa. Active steering can also be changed to manual operation. The change of the steering angle is consistent with the speed, results in a precise and stable steering track during higher speeds, low deviation in reverse and the manoeuvring is greatly improved.

### P2 Active wheel steering

Axis 3, 4 and 5, depending on the steering angle of axis 1 are steered by means of the steering wheel so that the steered turning path can be performed.

### P3 Axle steering

Axis 3, 4 and 5 are steered into the same direction as axis 1 and 2 by means of the steering wheel.

### P4 Steering without oversteer

Axis 3, 4 and 5 are steered in accordance with axis 1 so that no oversteer occurs at the rear of the carrier frame area.

### P5 Independent rear-axle steering

Axis 1 and 2 are steered by the steering wheel, axis 3, 4 and 5 are steered independently of the steering of axis 1 and 2 by independent control systems, thereby the steering of axis 1 is adapted to the required situation.

- It follows in the rear-axle steering three modes: it is effective and the rear axis are set to slight displacement by the steering wheel.
- Two independent hydraulic circuits with wheel and engine driven hydraulic pump, two maximum capacity, constant.
- Two independent control systems by steering wheel module and electronic control system.
- Enter into the rear of the "active rear-axle steering" by a button.
