Overcoming Data Scarcity in Earth Science Angela Gorgoglione,Alberto Castro Casales,Christian Chreties Ceriani,Lorena Etcheverry Venturini,2020-05-22 heavily Environmental mathematical models represent one of the key aids for scientists to forecast create and evaluate complex scenarios These models rely on the data collected by direct field observations However assembly of a functional and comprehensive dataset for any environmental variable is difficult mainly because of i the high cost of the monitoring campaigns and ii the low reliability of measurements e g due to occurrences of equipment malfunctions and or issues related to equipment location The lack of a sufficient amount of Earth science data may induce an inadequate representation of the response s complexity in any environmental system to any type of input change both natural and human induced In such a case before undertaking expensive studies to gather and analyze additional data it is reasonable to first understand what enhancement in estimates of system performance would result if all the available data could be well exploited Missing data imputation is an important task in cases where it is crucial to use all available data and not discard records with missing values Different approaches are available to deal with missing data Traditional statistical data completion methods are used in different domains to deal with single and multiple imputation problems More recently machine learning techniques such as clustering and classification have been proposed to complete missing data This book showcases the body of knowledge that is aimed at improving the capacity to exploit the available data to better represent understand predict and manage the behavior of environmental systems at all practical scales

Foundations for Sustainability A Coherent Framework of Life Environment Relations challenges existing assumptions on environmental issues and lays the groundwork for a new paradigm bringing a greater understanding of what is needed to help create an environmentally and economically sustainable future which to date has been an uphill battle and not an obvious choice The book presents the case for a paradigm based on a multi model of life as organism life as ecosystem and life as biosphere as opposed to the singular assumption that life can be viewed solely as an organism All backed with well cited research from top investigators from around the world this book is a must have resource for anyone working in ecology environmental science or sustainability Introduces a holistic systemic approach and a synthesis of the systemic root cause that underlies many surface symptoms that are part of individual environmental problems climate water energy etc Complements current piecemeal approaches in order to solve many interconnected environmental problems which share root causes Provides tests and thought experiments to challenge current views on sustainability leveraging the power of critical thinking to find new solutions Gives insights on how to find solutions by blending interdisciplinary and transdisciplinary focuses with disciplinary specialization in ecology and ecosystem science Bridges concepts and methods from math to ecology to human development *Big Data* Hassan A. Karimi, 2014-02-18 Big data has always been a major challenge in geoinformatics as geospatial data come in various types and formats new geospatial data are acquired very fast and geospatial databases are inherently very large And while there have been advances in hardware and software for handling big data they often fall short of handling geospatial big data ef *The Earth Observer*, 1995 **Getting the Climate Science Facts Right** Medani P. Bhandari, 2022-09-01 Getting the Climate Science Facts Right discusses climate change science with reference to the Intergovernmental Panel on Climate Change IPCC Addressing climate change is the most important public priority of the 21st Century Unlike many issues however this issue is being driven by both science and its interface with politics The main institution for bridging this division between science and international politics is the IPCC As

such it is the main source of the facts from which climate change policy is developed This book describes the ways in which the IPCC arrives at these facts and so can be sure they are complete and evidence based Seldom in history has science had such a direct relationship with politics The negotiation of an international policy regime requires at its outset an agreement on the facts In this case the facts are scientific complex and contentious Governments have recognized this and have by using the IPCC set up institutional machinery to provide facts from a source and in a manner that they can accept The way in which the IPCC functions is unique in that it melds the way in which science achieves consensus with the way governments do at the international level Starting with a process to examine review and debate scientific findings leading to a consensus about scientific fact usually expressed as probabilities that the findings will hold over time the IPCC then concludes by using the kind of consensus development mechanism that the United Nations typically uses to achieve agreements leading to the formation of policy regimes The book examines the structure of the IPCC its composition and its procedures in order to achieve an understanding of its role and future

National Spatial Data Infrastructure Partnership Programs

National Research Council, Division on Earth and Life Studies, Board on Earth Sciences and Resources, Mapping Science Committee, 2001-01-01 The National Spatial Data Infrastructure NSDI was envisioned as a way of enhancing the accessibility communication and use of geospatial data to support a wide variety of decisions at all levels of society The goals of the NSDI are to reduce redundancy in geospatial data creation and maintenance reduce the costs of geospatial data creation and maintenance improve access to geospatial data and improve the accuracy of geospatial data used by the broader community At the core of the NSDI is the concept of partnerships or collaborations between different agencies corporations institutions and levels of government In a previous report the Mapping Science Committee MSC defined a partnership as a joint activity of federal and state agencies involving one or more agencies as joint principals focusing on geographic information The concept of partnerships was built on the foundation of shared responsibilities shared costs shared benefits and shared control Partnerships are designed to share the costs of creation and maintenance of geospatial data seeking to avoid unnecessary duplication and to make it possible for data collected by one agency at a high level of spatial detail to be used by another agency in more generalized form Over the past seven years a series of funding programs administered by the Federal Geographic Data Committee FGDC has stimulated the creation of such partnerships and thereby promoted the objectives of the NSDI by raising awareness of the need for a coordinated national approach to geospatial data creation maintenance and use They include the NSDI Cooperative Agreements Program the Framework Demonstration Projects Program the Community Demonstration Projects and the Community Federal Information Partnerships proposal This report assesses the success of the FGDC partnership programs that have been established between the federal government and state and local government industry and academic communities in promoting the objectives of the National Spatial Data Infrastructure
