

FTIR SPECTROSCOPY REFERENCE GUIDE

The Measure of Confidence

INTRODUCTION

Infrared spectroscopy is the study of the interaction of light (infrared electromagnetic energy) with matter. The spectrum of infrared radiation covers the absorption of infrared energy by molecules and provides information about the chemical structure of a sample. A typical spectral range of 4000 to 600 cm⁻¹ is used for the identification of unknown samples and comparison with known samples. This range is divided into four regions:

ELECTROMAGNETIC SPECTRUM

Relative to the visible light spectrum, infrared radiation is divided into a far infrared spectrum (100 to 1000 cm⁻¹) and a near infrared spectrum (1000 to 4000 cm⁻¹). The far infrared spectrum is used for the identification of unknown samples and comparison with known samples. The near infrared spectrum is used for the identification of unknown samples and comparison with known samples.

Convert a wavenumber to a wavelength (in micrometers) using the following formula:

$$\lambda(\mu\text{m}) = \frac{10,000}{\text{Wavenumber (cm}^{-1}\text{)}}$$

Convert a wavenumber to a wavelength (in micrometers) using the following formula:

CONSIDERATIONS FOR THE USER

There are three main considerations for the user when using an FTIR spectrometer:

- 1. Sample preparation: The sample must be prepared in a way that allows for the measurement of the infrared energy.
- 2. Instrument calibration: The instrument must be calibrated using a known sample.
- 3. Data analysis: The data must be analyzed using a software program.

The following considerations are for the user when using an FTIR spectrometer:

A Practical Guide to Geometric Regulation for Distributed Parameter Systems Eugenio Aulisa, David Gilliam, 2015-06-18 A Practical Guide to Geometric Regulation for Distributed Parameter Systems provides an introduction to geometric control design methodologies for asymptotic tracking and disturbance rejection of infinite dimensional systems The book also introduces several new control algorithms inspired by geometric invariance and asymptotic attraction for a wide range of dynamical control systems The first part of the book is devoted to regulation of linear systems beginning with the mathematical setup general theory and solution strategy for regulation problems with

bounded input and output operators The book then considers the more interesting case of unbounded control and sensing Mathematically this case is more complicated and general theorems in this area have become available only recently The authors also provide a collection of interesting linear regulation examples from physics and engineering The second part focuses on regulation for nonlinear systems It begins with a discussion of theoretical results characterizing solvability of nonlinear regulator problems with bounded input and output operators The book progresses to problems for which the geometric theory based on center manifolds does not directly apply The authors show how the idea of attractive invariance can be used to solve a series of increasingly complex regulation problems The book concludes with the solutions of challenging nonlinear regulation examples from physics and engineering

Heterogeneous Catalysts Michel Che, Jacques C. Védrine, 2012-04-16. This two-volume book provides an overview of physical techniques used to characterize the structure of solid materials on the one hand and to investigate the reactivity of their surface on the other. Therefore, this book is a must-have for anyone working in fields related to surface reactivity. Among the latter, and because of its most important industrial impact, catalysis has been used as the directing thread of the book. After the preface and a general introduction to physical techniques by M. Che and J. C. Védrine, two overviews on physical techniques are presented by G. Ertl and Sir J. M. Thomas for investigating model catalysts and porous catalysts, respectively. The book is organized into four parts: Molecular, Local, Spectroscopic, Macroscopic Techniques; Characterization of the Fluid Phase: Gas and/or Liquid; and Advanced Characterization. Each chapter focuses upon the following important themes: overview of the technique; most important parameters to interpret the experimental data; practical details; applications of the technique, particularly during chemical processes, with its advantages and disadvantages; conclusions. *Global Impacts of Micro- and*
