Expansion Joints In Buildings Technical Report No 65:

Expansion Joints in Buildings National Research Council, Division on Engineering and Physical Sciences, Federal Facilities Council, Building Research Advisory Board, Standing Committee on Structural Engineering of the Federal Construction Council, 1974-02-01 Many factors affect the amount of temperature induced movement that occurs in a building and the extent to which this movement can occur before serious damage develops or extensive maintenance is required In some cases joints are being omitted where they are needed creating a risk of structural failures or causing unnecessary operations and maintenance costs In other cases expansion joints are being used where they are not required increasing the initial cost of construction and creating space utilization problems As of 1974 there were no nationally acceptable procedures for precise determination of the size and the location of expansion joints in buildings Most designers and federal construction agencies individually adopted and developed guidelines based on experience and rough calculations leading to significant differences in the various guidelines used for locating and sizing expansion joints In response to this complex problem *Expansion Joints in Buildings Technical Report No 65* provides federal agencies with practical procedures for evaluating the need for through building expansion joints in structural framing systems The report offers guidelines and criteria to standardize the practice of expansion joints in buildings and decrease problems associated with the misuse of expansion joints *Expansions Joints in Buildings Technical Report No 65* also makes notable recommendations concerning expansion isolation joints and the manner in which they permit separate segments of the structural frame to expand and to contract in response to temperature fluctuations without adversely affecting the buildings structural integrity or serviceability

Reinforced Concrete Buildings David C. Gray,David Darwin,1984 **Rigidly Framed Earth Retaining Structures** Walid

Aboumoussa, Magued Iskander, 2014-06-23 Structures placed on hillsides often present a number of challenges and a limited number of economical choices for site design. An option sometimes employed is to use the building frame as a retaining element comprising a Rigidly Framed Earth Retaining Structure (RFERS). The relationship between temperature and earth pressure acting on RFERS is explored in this monograph through a 4 5 year monitoring program of a heavily instrumented in service structure. The data indicated that the coefficient of earth pressure behind the monitored RFERS had a strong linear correlation with temperature. The study also revealed that thermal cycles rather than lateral earth pressure were the cause of failure in many structural elements. The book demonstrates that depending on the relative stiffness of the retained soil mass and that of the structural frame the developed lateral earth pressure during thermal expansion can reach magnitudes several times larger than those determined using classical earth pressure theories. Additionally a nearly perpetual lateral displacement away from the retained soil mass may occur at the free end of the RFERS leading to unacceptable serviceability problems. These results suggest that reinforced concrete structures designed for the flexural stresses imposed by the backfill soil will be inadequately reinforced to resist stresses produced during the expansion cycles. Parametric studies of single and multi story RFERS with varying geometries and properties are also presented to investigate the effects of structural stiffness on the displacement of RFERS and the lateral earth pressure developed in the soil mass. These studies can aid the reader in selecting appropriate values of lateral earth pressure for the design of RFERS. Finally simplified closed form equations that can be used to predict the lateral drift of RFERS are presented. Geological and Geotechnical Engineering in the New Millennium National Research Council, Division on Earth and Life Studies, Board on Earth Sciences and Resources, Committee on Geological and Geotechnical Engineering, Committee on Geological and Geotechnical Engineering in the New Millennium: Opportunities for Research and Technological Innovation, 2006-03-03 The field of geoengineering is at a crossroads where the path to high tech solutions meets the path to expanding applications of geotechnology. In this report the term geoengineering includes all types of engineering that deal with Earth materials such as geotechnical engineering geological engineering hydrological engineering and Earth related parts of petroleum engineering and mining engineering. The rapid expansion of nanotechnology biotechnology and information technology begs the question of how these new approaches might come to play in developing better solutions for geotechnological problems. This report presents a vision for the future of geotechnology aimed at National Science Foundation NSF program managers the geological and geotechnical engineering community as a whole and other interested parties including Congress federal and state agencies industry academia and other stakeholders in geoengineering research.

Some of the ideas may be close to reality whereas others may turn out to be elusive but they all present possibilities to strive for and potential goals for the future Geoengineers are poised to expand their roles and lead in finding solutions for modern Earth systems problems such as global change emissions free energy supply global water supply and urban systems
