Convex Optimization Techniques for Geometric Covering Problems Jan Hendrik Rolfes, 2021-09-15 The present thesis is a commencement of a generalization of covering results in specific settings such as the Euclidean space or the sphere to arbitrary compact metric spaces In particular we consider coverings of compact metric spaces $X \subset \mathbb{R}^d$ by balls of radius r We are interested in the minimum number of such balls needed to cover X denoted by $N_{\text{cal}}(X, r)$ For finite X this problem coincides with an instance of the combinatorial textsc set cover problem which is $\text{mathrm{NP}}$ complete We illustrate approximation techniques based on the moment method of Lasserre for finite graphs and generalize these techniques to compact metric spaces X to obtain upper and lower bounds for $N_{\text{cal}}(X, r)$ The upper bounds in this thesis follow from the application of a greedy algorithm on the space X Its approximation quality is obtained by a generalization of the analysis of Chvátal's algorithm for the weighted case of textsc set cover We apply this greedy algorithm to the spherical case $X \subset S^n$ and retrieve the best non asymptotic bound of Borsuk and Wintsche Additionally the algorithm can be used to determine coverings of Euclidean space with arbitrary measurable objects having non empty interior The quality of these coverings slightly improves a bound of Naszodi For the lower bounds we develop a sequence of bounds $N_{\text{cal}}(t, X, r)$ that converge after finitely say α in N many steps $N_{\text{cal}}(1, X, r) \leq \dots \leq N_{\text{cal}}(\alpha, X, r) \leq N_{\text{cal}}(X, r)$ The drawback of this sequence is that the bounds $N_{\text{cal}}(t, X, r)$ are increasingly difficult to compute since they are the objective values of infinite

dimensional conic programs whose number of constraints and dimension of underlying cones grow accordingly to n . We show that these programs satisfy strong duality and derive a finite dimensional semidefinite program to approximate $\text{Ncal}^2(S^2, r)$ to arbitrary precision. Our results rely in part on the moment methods developed by de Laet and Vallentin for the packing problem on topological packing graphs. However in the covering problem we have to deal with two types of constraints instead of one type as in packing problems and consequently additional work is required.

Stochastic and Infinite Dimensional Analysis Christopher C. Bernido, Maria Victoria Carpio-Bernido, Martin Grothaus, Tobias Kuna, Maria João Oliveira, José Luís da Silva, 2016-08-10 This volume presents a collection of papers covering applications from a wide range of systems with infinitely many degrees of freedom studied using techniques from stochastic and infinite dimensional analysis e.g. Feynman path integrals, the statistical mechanics of polymer chains, complex networks and quantum field theory. Systems of infinitely many degrees of freedom create their particular mathematical challenges which have been addressed by different mathematical theories, namely in the theories of stochastic processes, Malliavin calculus and especially white noise analysis. These proceedings are inspired by a conference held on the occasion of Prof. Ludwig Streit's 75th birthday and celebrate his pioneering and ongoing work in these fields.

Regularity and Scattering of Dispersive Wave Equations Changxing Miao, Ruipeng Shen, 2025-02-17 The book places emphasis on both the mathematical significance and the strong physical background of wave equations. It presents the theory of wave equations in a unique way different from the traditional descriptions provided by previous literature. The book is primarily focused on mathematical ideas and thoughts about wave equations. Starting from the modern theory of harmonic analysis, the book develops a few new tools in this field that are being used for better understanding the theory of mathematical physics underlying the well-posedness and scattering theory of wave and Klein-Gordon equations. Additionally, a significant part of this book discusses theories and methods such as invariant and conservation laws, inward/outward energy methods, etc. that have never been covered by similar books in this field. Finally, the book briefly introduces recent developments in mathematical fields. It is specially designed for experts in mathematics and physics who deal with numerous applications of nonlinear waves in physics, engineering, biology and other fields.

Functional Analysis, Calculus of Variations and Numerical Methods for Models in Physics and Engineering Fabio Silva Botelho, 2020-11-02 The book discusses basic concepts of functional analysis, measure and integration theory, calculus of variations and duality and its applications to variational problems of non-convex nature such as the Ginzburg-Landau system in superconductivity, shape optimization models, dual variational formulations for micro-magnetism and others. Numerical Methods for such and similar problems such as models in flight mechanics and the Navier-Stokes system in fluid mechanics have been developed through the generalized method of lines including their matrix finite dimensional approximations. It concludes with a review of recent research on Riemannian geometry applied to Quantum Mechanics and Relativity. The book will be of interest to applied mathematicians and graduate students in applied mathematics, Physicists, engineers and

researchers in related fields will also find the book useful in providing a mathematical background applicable to their respective professional areas

Analytic Partial Differential Equations François Trèves, 2022-04-26

This book provides a coherent self contained introduction to central topics of Analytic Partial Differential Equations in the natural geometric setting The main themes are the analysis in phase space of analytic PDEs and the Fourier-Bros-Iagolnitzer FBI transform of distributions and hyperfunctions with application to existence and regularity questions The book begins by establishing the fundamental properties of analytic partial differential equations starting with the Cauchy-Kovalevskaya theorem before presenting an integrated overview of the approach to hyperfunctions via analytic functionals first in Euclidean space and once the geometric background has been laid out on analytic manifolds Further topics include the proof of the Łojasiewicz inequality and the division of distributions by analytic functions a detailed description of the Frobenius and Nagano foliations and the Hamilton-Jacobi solutions of involutive systems of eikonal equations The reader then enters the realm of microlocal

analysis through pseudodifferential calculus introduced at a basic level followed by Fourier integral operators including those with complex phase functions la Sj strand This culminates in an in depth discussion of the existence and regularity of distribution or hyperfunction solutions of analytic differential and later pseudodifferential equations of principal type exemplifying the usefulness of all the concepts and tools previously introduced The final three chapters touch on the possible extension of the results to systems of over or under determined systems of these equations a cornucopia of open problems This book provides a unified presentation of a wealth of material that was previously restricted to research articles In contrast to existing monographs the approach of the book is analytic rather than algebraic and tools such as sheaf cohomology stratification theory of analytic varieties and symplectic geometry are used sparingly and introduced as required The first half of the book is mainly pedagogical in intent accessible to advanced graduate students and postdocs while the second more specialized part is intended as a reference for researchers

The text comprises three extensive contributions covering the following topics: 1. Operator Valued H^∞ calculus, R -boundedness, Fourier multipliers and maximal L_p regularity theory for a large abstract class of quasi-linear evolution problems with applications to Navier-Stokes equations and other fluid model equations; 2. Classical existence, uniqueness and regularity theorems of solutions to the Navier-Stokes initial value problem along with space-time partial regularity and investigation of the smoothness of the Lagrangian flow map; and 3. A complete mathematical theory of R -boundedness and maximal regularity with applications to free boundary problems for the Navier-Stokes equations with and without surface tension. Offering a general mathematical framework that could be used to study fluid problems and more generally a wide class of abstract evolution equations, this volume is aimed at graduate students and researchers who want to become acquainted with fundamental problems related to the Navier-Stokes equations.
