FUNCTIONAL EVALUATION: THE BARTHEL INDEX

*A simple index of independence useful in scoring improvement
in the rehabilitation of the chronically ill*

Since 1955, the chronic disease hospitals in Maryland (Montebello State Hospital, Deer's Head Hospital, and Western Maryland Hospital) have been using a simple index of independence to score the ability of a patient with a neuro-muscular or musculoskeletal disorder to care for himself, and by repeating the test periodically, to assess his improvement. The Index (BI) has also been taught to many nurses, who have been helpful in evaluating patients prior to admission to these hospitals and after discharge.

FLORENCE I. MAHONEY, M.D.
AND
DOROTHEA W. BARTHEL, BA, PT

The values assigned to each item are based on time and amount of actual physical assistance required if a patient is unable to perform the activity. Full credit is not given for an activity if the patient needs even minimal help and/or supervision, i.e., if he cannot safely perform the activity without someone present in the room with him. Because of the time required to attend an incontinent patient and since he is not socially acceptable, continence was weighted heavily.

Environmental conditions may affect the patient's score. If he has special requirements (other than the usual home setting), his score will be lower when they are not met. Examples are: doorways wide enough for easy access by wheelchair; all rooms on the same level if he cannot walk; grab bars at the toilet and tub.

To be more valuable, an explanation of special environmental requirements should accompany the BI of each patient when these are indicated.

Each patient's BI is scored at the beginning of treatment in the Rehabilitation Service (PM&R), at intervals during the course of his rehabilitation, and at the time of maximum benefit. In this way, it is possible to determine how well and how rapidly he has progressed toward independence. Sometimes improvement does not show up because the presence of another person may still be required even though he does not actually give physical assistance. Usually lack of improvement in the BI after a reasonable period of treatment indicates poor potential for rehabilitation.

Functional Evaluation The Barthel Index:

Functional Evaluation of Stroke Patients Naoichi Chino, John L. Melvin, 2012-12-06 Stroke is one of the major causes of disability in the world. Consequently, an effective rehabilitation regimen is the goal of specialists working in the field worldwide. The implementation of rehabilitation programs for the stroke patient is broad in scope and requires first of all an objective scientific evaluation method. In 1980 the World Health Organization developed the International Classification of Impairments, Disabilities and Handicaps. It categorized impairments and disabilities on the basis of functional evaluation but took into account cultural and socioeconomic factors when defining handicaps, thus making it difficult to use the same functional evaluation instrument for the three phenomena. In this monograph, experts in the treatment of stroke from Japan, the United States, and Europe share their ideas presented during the 31st Annual Convention of the Japanese Association of Rehabilitation Medicine held in June 1994. All the participants freely contributed their views on the functional assessment and prognosis of stroke patients. Indeed, their contributions shed light on possible breakthroughs in the future for the development of rehabilitation regimens for stroke patients.

Schließlich werden aktuelle Entwicklungen im Bereich der computergestützten Diagnostik, insbesondere zum adaptiven Testen, aufgegriffen. Hierzu werden neue Ansätze zum internetgestützten Testen beleuchtet und damit verbundene Vor- und Nachteile technischer Innovationen diskutiert.

Kritische Diskussion von Testinterpretationen. Praxisnahe Fallbeispiele. Merksätze. Hinweise auf Fehlerquellen. Psychologische Diagnostik ist neben medizinischer unverzichtbar, wenn über Therapie und rechtliche Aspekte bei Demenz entschieden wird. Wie kann man zuverlässig messen, wie gut Gedächtnis, Denken, Konzentration und alltagspraktisches Handeln bei Menschen mit Verdacht auf Demenz funktionieren? Was ist bei der Interpretation von Testergebnissen zu beachten? Die Autorin gibt einen systematischen Überblick über die häufigsten psychologischen Screenings und Tests. Sie erklärt die Bedeutung von Kennwerten und ordnet die Aussagekraft einzelner Testergebnisse kritisch ein. Vergleichende tabellarische Übersichten, Kasuistiken, Glossar und Testverzeichnis zum schnellen Nachschlagen machen das Buch zu einem unverzichtbaren Begleiter für die demenzdiagnostische Praxis.
