

Problem

An apparatus for measuring thermal conductivity employs an electrical heater sandwiched between two identical samples of diameter 30 mm and length 60 mm, which are pressed between plates maintained at a uniform temperature $T_0 = 77^\circ\text{C}$ by a circulating fluid. A conducting grease is placed between all the surfaces to ensure good thermal contact. Differential thermocouples are imbedded in the samples with a spacing of 15 mm. The lateral sides of the samples are insulated to ensure one dimensional heat transfer through the samples.

(a) With two samples of SS316 in the apparatus, the heater draws 0.353A at 100 V, and the differential thermocouples indicate $\Delta T_1 = \Delta T_2 = 25.0^\circ\text{C}$. What is the thermal conductivity of the stainless steel sample material? What is the average temperature of the samples? Compare your result with the thermal conductivity value reported for this material in Table A.1.
