*Frontiers of Propulsion Science* Marc G. Millis, Eric W. Davis, 2009 Frontiers of Propulsion Science is the first ever compilation of emerging science relevant to such notions as space drives warp drives gravity control and faster than light travel the kind of breakthroughs that would revolutionize spaceflight and enable human voyages to other star systems Although these concepts might sound like science fiction they are appearing in growing numbers in reputable scientific journals This is a nascent field where a variety of concepts and issues are being explored in the scientific literature beginning in about the early 1990s The collective status is still in step 1 and 2 of the scientific method with initial observations being made and initial hypotheses being formulated but a small number of approaches are already at step 4 with experiments underway This emerging science combined with the realization that rockets are fundamentally inadequate for interstellar exploration led NASA to support the Breakthrough Propulsion Physics Project from 1996 through 2002 Frontiers of Propulsion Science covers that project as well as other related work so as to provide managers scientists engineers and graduate students with enough starting material that they can comprehend the status of this research and decide if and how to pursue it in more depth themselves Five major sections are included in the book Understanding the Problem lays the groundwork for the technical details to follow Propulsion Without Rockets discusses space drives and gravity control both in general terms and with specific examples

Faster Than Light Travel starts with a review of the known relativistic limits followed by the faster than light implications from both general relativity and quantum physics Energy Considerations deals with spacecraft power systems and summarizes the limits of technology based on accrued science and From This Point Forward offers suggestions for how to manage and conduct research on such visionary topics

**Listening with Two Ears - New Insights and Perspectives in Binaural Research** Huiming Zhang,Yi Zhou,Lina Reiss,2023-11-27 Hearing is dependent on neural processing of acoustic cues obtained by the left and right ears Neural signals driven by the two ears are integrated at multiple levels of the central auditory system which enables animals including humans to perform various functions including localization of a sound source A natural listening environment typically contains sounds from multiple sources These sounds can have different spectral and temporal features and occur at either the same or different time Integration can happen among neural signals elicited by the same or different sounds The way of integration can greatly affect how individual sounds are sensed and perceived Functions such as auditory grouping and stream segregation which are central to establishing coherent auditory images in a complex listening environment are highly dependent on the way of integration Binaural hearing is complicated by individual differences and developmental changes in head and pinna shape size as binaural cues can be affected by these differences and changes Furthermore neural processing of binaural cues can be influenced by hearing impairments and the use of hearing aids and cochlear implants These factors likely require a listener to optimize the use of binaural cues through learning and to use plastic changes in the nervous system to perform the optimization Great strides have been made in understanding binaural processing in normal and impaired auditory systems This Research Topic aims to highlight some of the latest findings in the following areas 1 Animal behavioral and human psychoacoustical studies of binaural hearing 2 Neural encoding and processing of binaural cues and structural as well as neurophysiological bases of such encoding and processing 3 Contribution of binaural neural processing to auditory functions such as sound source localization binaural fusion binaural interference spatial release from masking auditory grouping and auditory stream segregation 4 Computational models of binaural processing 5 Learning and plastic changes in binaural processing following hearing loss or alterations of acoustic environment and structural as well as physiological bases of these behavioral changes 6 Clinical aspects of binaural processing including application of processing strategies including research on the benefits of bilateral cochlear implantation and the neural correlates thereof
