*Diabetes and Cardiovascular Disease* Michael T. Johnstone, Aristidis Veves, 2007-10-28 The cause of diabetes mellitus is metabolic in origin However its major clinical manifestations which result in most of the morbidity and mortality are a result of its vascular pathology In fact the American Heart Association has recently stated that from the point of view of cardiovascular medicine it may be appropriate to say diabetes is a cardiovascular disease 1 But diabetic vascular disease is not limited to just the macrovasculature Diabetes mellitus also affects the microcirculation with devastating results including nephropathy neuropathy and retinopathy Diabetic nephropathy is the leading cause of end stage renal disease in the United States while diabetic retinopathy is the leading cause of new onset blindness in working age Americans The importance of this text on Diabetes and Cardiovascular Disease is evident by the magnitude of the population affected by diabetes mellitus Over 10 million Americans have been diagnosed with diabetes mellitus while another 5 million remain undiagnosed The impact from a public health perspective is huge and increasing As the population of the United States grows older more sedentary and obese the risk of developing diabetes and its complications will increase Epidemiological studies have identified diabetes mellitus as a major independent risk factor for cardiovascular disease Over 65% of patients with diabetes mellitus die from a cardiovascular cause The prognosis of patients with diabetes mellitus who develop overt clinical cardiovascular disease is much worse than those cardiovascular patients free of diabetes mellitus

McMurray, 2008-02-28. With cardiovascular disease becoming the most common cause of death in people with diabetes, interest in the assessment and treatment of heart disease in these patients has been reawakened. This book examines developing topics from a largely cardiological perspective, covering both pharmacological and non-pharmacological interventions. The DIGAMI study on the use of intravenous insulin infusion at the time of myocardial infarction (MI) has stimulated a large number of discussion papers on the best treatment of MI in the diabetic patient. The UKPDS has shown that treatment of Type 2 diabetes does not reduce cardiovascular end points significantly, but that aggressive treatment of blood pressure can do so. In addition, subgroup analysis from several large cardiovascular trials has shown that treatment with statins, antiplatelet therapy, ACE inhibitors, and other drugs will also reduce cardiovascular events in people with diabetes. *Diabetes in der Praxis* Werner-Klaus Waldhäusl, F.
