

Digital vs. Analog Signals

Read the text, and then answer the questions that follow.

Imagine you are listening to music on your cell phone in your hometown. You find a new song that you love, and you know your cousin who lives across the country would love it, too. So, in a flash of your fingers, you send the song to your cousin via text message. In a matter of minutes, she replies to tell you it's her new favorite song.

Sharing music has not always been so easy. Prior to the 1980s, you might have shared a song with your far-away cousin by asking her on the telephone and telling her the title of the song in hopes she could get her hands on a copy of the album or catch it on the radio. The ease with which we are now able to access and share music is thanks to digital signals. Digital signals are a more reliable way to encode and transmit information than analog signals.

An analog signal is a representation, or analogy, of something that you convey with continuous data. A song produced by playing a record is an example of an analog signal. Records are made

of a plastic called vinyl. They have microscopic grooves, which the needle on the record player follows. As the needle moves over the microscopic grooves, it moves up and down thousands of times each second, causing vibrations that are then amplified to play a song we can hear. So, a record produces an analog signal made of continuous data. The signal produced can be represented as a smooth wave that describes exactly how the sound changes over time. A radio is another example of a device that uses analog signals. It detects AM and FM radio waves, which make a speaker inside the radio vibrate to produce sound.

Though analog signals are widely used, they can sometimes be an unreliable way to encode and transmit information. For example, you can't share songs as

quickly or as easily over long distances using records, and if you scratch a record, you permanently distort the sound it produces. Or if you travel too far from a radio tower, you hear static over the radio because the signal degrades. When this happens, we say that the signal is noisy.

A more reliable way to encode and transmit information is with digital signals. A digital signal is a signal in which continuous data has been translated to a series of noncontinuous digits, like ones and zeros. Why would we want a signal translated into ones and zeros? Because that's how computers read data. Every song on your cell phone or computer is stored as a long string of ones and zeros, called binary code. To store a song digitally, points along sound waves from the song are sampled. Each point is assigned a number based on its amplitude. Those numbers are then translated into a digital code that a computer can read. To turn the digital code back into sound, your cell phone or computer reads the digital code and creates a sound wave to send to the speaker. The speaker then creates sound waves that travel through the air and to your ears.
