**Design and Analysis of Distributed Algorithms with Applications to Networked Traffic Systems** Evan Gravelle, 2017 There are many benefits of solving problems in a decentralized manner Distributed algorithms often do not require global information which can alleviate the curse of dimensionality in large networks there is often robustness to failure of parts and they are often more robust to failure of parts and to dynamic changes to the environment that can occur while maintaining performance This dissertation will focus on three problems involving networked systems in which distributed algorithms have significant benefits constrained load balancing traffic congestion minimization and traffic intersection efficiency Many physical limitations of real systems are not considered in the literature of distributed load balancing algorithms We address the specific problem of quantized distributed load balancing over a network of agents subject to upper limit constraints We then shift focus to traffic systems where endowing traffic control systems with local information and communication can be exploited for further efficiency Motivated by a desire to reduce congestion we propose two distributed algorithms to reduce delays a dynamic lane reversal algorithm and a rerouting algorithm Finally we present a novel intersection control algorithm based on an objective function that accounts for drivers time preferences For each problem a specific objective is formed mathematically An algorithm is designed to achieve this objective and stability and convergence of the algorithms are analyzed Experiments are run through simulation to verify stability and convergence as well as to test performance

*The Theory of Timed I/O Automata, Second Edition* Dilsun Kaynar, Nancy Lynch, Roberto Segala, Frits Vaandrager, 2022-06-01 This monograph presents the Timed Input Output Automaton TIOA modeling framework a basic mathematical framework to support description and analysis of timed computing systems Timed systems are systems in which desirable correctness or performance properties of the system depend on the timing of events not just on the order of their occurrence Timed systems are employed in a wide range of domains including communications embedded systems real time operating systems and automated control Many applications involving timed systems have strong safety reliability and predictability requirements which make it important to have methods for systematic design of systems and rigorous analysis of timing dependent behavior The TIOA framework also supports description and analysis of timed distributed algorithms distributed algorithms whose correctness and performance depend on the relative speeds of processors accuracy of local clocks or communication delay bounds Such algorithms arise for example in traditional and wireless communications networks of mobile devices and shared memory multiprocessors The need to prove rigorous theoretical results about timed distributed algorithms makes it important to have a suitable mathematical foundation An important feature of the TIOA framework is its support for decomposing timed system descriptions In particular the framework includes a notion of external behavior for a timed I O automaton which captures its

discrete interactions with its environment The framework also defines what it means for one TIOA to implement another based on an inclusion relationship between their external behavior sets and defines notions of simulations which provide sufficient conditions for demonstrating implementation relationships The framework includes a composition operation for TIOAs which respects external behavior and a notion of receptiveness which implies that a TIOA does not block the passage of time The TIOA framework also defines the notion of a property and what it means for a property to be a safety or a liveness property It includes results that capture common proof methods for showing that automata satisfy properties
