The Numerical Solution of Systems of Polynomials Arising in Engineering and Science Andrew John Sommese, Charles Weldon Wampler (II.), 2005 Written by the founders of the new and expanding field of numerical algebraic geometry this is the first book that uses an algebraic geometric approach to the numerical solution of polynomial systems and also the first one to treat numerical methods for finding positive dimensional solution sets The text covers the full theory from methods developed for isolated solutions in the 1980 s to the most recent research on positive dimensional sets

Scheduling of Resource-Constrained Projects Robert Klein, 2012-12-06 Project management has become a widespread instrument enabling organizations to efficiently master the challenges of steadily shortening product life cycles global markets and decreasing profit margins With projects increasing in size and complexity their planning and control represents one of the most crucial management tasks This is especially true for scheduling which is concerned with establishing execution dates for the sub activities to be performed in order to complete the project The ability to manage projects where resources must be allocated between concurrent projects or even sub activities of a single project requires the use of commercial project management software packages However the results yielded by the solution procedures included are often rather unsatisfactory Scheduling of Resource Constrained Projects develops more efficient procedures which can easily be integrated into software packages by incorporated programming languages and thus should be of great interest for practitioners as well as scientists working in the field of project management The book is divided into two parts In Part I the project management process is described and the management tasks to be accomplished during project planning and control are discussed This allows for identifying the major scheduling problems arising in the planning process among which the resource constrained project scheduling problem is the most important Part II deals with efficient computer based procedures for the resource constrained project scheduling problem and its generalized version Since both problems are NP hard the development of such procedures which yield satisfactory solutions in a reasonable amount of computation time is very challenging and a number of new and very promising approaches are introduced This includes heuristic procedures based on priority rules and tabu search as well as lower bound methods and branch and bound procedures which can be applied for computing optimal solutions

Developments in Reliable Computing Tibor Csendes, 2013-04-17 The SCAN conference the International Symposium on Scientific Computing Computer Arithmetic and Validated Numerics takes place biannually under the joint auspices of GAMM Gesellschaft für Angewandte Mathematik und Mechanik and IMACS International Association for Mathematics and Computers in Simulation SCAN 98 attracted more than 100 participants from 21 countries all over the world During the four days from September 22 to 25 nine highlighted plenary lectures and over 70 contributed talks were given These figures indicate a large participation which was partly caused by the attraction of the organizing country Hungary but also the effective support system have contributed to the success The conference was

substantially supported by the Hungarian Research Fund OTKA GAMM the National Technology Development Board OMFB and by the J6zsef Attila University Due to this funding it was possible to subsidize the participation of over 20 scientists mainly from Eastern European countries It is important that the possibly first participation of 6 young researchers was made possible due to the obtained support The number of East European participants was relatively high These results are especially valuable since in contrast to the usual 2 years period the present meeting was organized just one year after the last SCAN xx conference

Polynomial Diophantine Equations Bogdan Grechuk, 2024-09-01 This book proposes a novel approach to the study of Diophantine equations define an appropriate version of the equation s size order all polynomial Diophantine equations by size and then solve the equations in order Natural questions about the solution set of Diophantine equations are studied in this book using this approach Is the set empty Is it finite or infinite Can all integer solutions be parametrized By ordering equations by size the book attempts to answer these questions in a systematic manner When the size grows the difficulty of finding solutions increases and the methods required to determine solutions become more advanced Along the way the reader will learn dozens of methods for solving Diophantine equations each of which is illustrated by worked examples and exercises The book ends with solutions to exercises and a large collection of open problems often simple to write down yet still unsolved The original approach pursued in this book makes it widely accessible Many equations require only high school mathematics and creativity to be solved so a large part of the book is accessible to high school students especially those interested in mathematical competitions such as olympiads The main intended audience is undergraduate students for whom the book will serve as an unusually rich introduction to the topic of Diophantine equations Many methods from the book will be useful for graduate students while Ph D students and researchers may use it as a source of fascinating open questions of varying levels of difficulty
