For Scientists
and Engineers

An abstract illustration featuring a large, glowing orange and yellow lens-like shape on the left. From this shape, numerous thin, parallel lines of light in shades of blue, green, and yellow emerge, fanning out towards the right. Some of these lines are straight, while others are slightly curved. On the right side, there is a cluster of these light lines, some of which appear to be reflecting off a surface or interacting with each other. The background is a dark, textured blue with some lighter, swirling patterns.

Joshua D. Vande Hey, 2014-11-19 In this thesis a new lidar light detection and ranging ceilometer capable of monitoring cloud base and sensitive to boundary layer aerosols is introduced The key to this novelty lies in its divided lens design that addresses a classical lidar problem of balancing transmitter receiver overlap and signal to noise ratio along with a method for characterizing overlap in the laboratory Enhanced sensitivity in the near range of the instrument is achieved without compromising signal to noise in a design that is straightforward to manufacture for broad deployment The instrument its optical characterization and its performance in the field are described The prototype instrument described here has since formed the basis of a commercial sensor for monitoring clouds and aerosols High resolution continuous observations of clouds and aerosols are needed to reduce the large uncertainties in our current understanding of their influence on climate that have been highlighted by the International Panel on Climate Change And as international health organizations indicate growing public health threats over the coming decades resulting from poor air quality extensive aerosol monitoring is required to assess personal exposure to and the health impacts of anthropogenic particulates Ground based optical remote sensing measurements made by well characterized instruments such as that described in these pages are critical to this
