environmental conditions and climate change It is projected that potato yield may decrease up to 32 per cent by 2050 due to increasing temperatures and drought conditions Thus future potato breeding programmes should focus on enhancing abiotic and biotic stress tolerance through the utilization of the natural germplasm conserved in different gene banks along with climate friendly agronomical practices Moreover potato breeding should benefit from the effectiveness and ease of molecular techniques such as marker assisted selection genome wide association studies functional genomics and transgenics The development of new potato varieties can also be achieved via genetic engineering and genome editing Disease free potato seed production requires the integration of tissue culture methods followed by the production of mini tubers under an aeroponic system As it is a staple food for millions and demand for potatoes will increase in the future which makes this crop suitable for future research Hence the present book is formulated for professionals researchers and post graduate students who is working with advanced production breeding and post harvest technologies on potato crop specially in Indian perspective
