Design of Integrally-Attached Timber Plate Structures Yves Weinand,2021-09-26 Design of

Integrally Attached Timber Plate Structures outlines a new design methodology for digitally fabricated spatial timber plate structures presented with examples from recent construction projects It proposes an innovative and sustainable design methodology algorithmic geometry processing structural optimization and digital fabrication technology transfer and construction are formulated and widely discussed The methodology relies on integral mechanical attachment whereby the connection between timber plates is established solely through geometric manipulation without additional connectors such as nails screws dowels adhesives or welding The transdisciplinary design framework for spatial timber plate structures brings together digital architecture computer science and structural engineering covering parametric modeling and architectural computational design geometry exploration the digital fabrication assembly of engineered timber panels numerical simulations mechanical characterization design optimization and performance improvement The method is demonstrated through different prototypes physical models and three build examples focusing specifically on the design of the timber plate roof structure of 23 large span arches called the Annen Headquarters in Luxembourg This is useful for the architecture engineering and construction AEC sector and shows how new structural optimization processes can be reinvented through geometrical adaptations to control global and local geometries of complex structures This text is ideal for structural engineering professionals and architects in both industry and academia and construction companies
