ABSTRACT

The aim of this paper is to present a simple method of construction of the load-transfer P-Y curves for the design of laterally loaded piles in sand based on the cone penetration test (CPT). The proposed method was developed on the basis of interpretation of 5 field tests on single instrumented piles conducted in sandy sites in France and shows a simple relationship linking the P-Y curve parameters, the cone penetration resistance and the lateral pile/soil stiffness ratio.

The validation process was carried out by direct comparison of the predicted load-deflection curves based on the proposed method to those obtained from a worldwide case history of field lateral loading tests on piles and showed a very good quality of the prediction using the proposed method.

KEYWORDS: Piles, Lateral load, Sand, Full-scale loading, P-Y curves, CPT test.

INTRODUCTION

The accumulation of case histories of field lateral loading tests on piles carried out worldwide shows that the load-deflection behaviour is governed by a multitude of parameters involved in such an interaction. The theoretical modeling of laterally loaded piles is a difficult task due to the 3D response of the pile/soil system. In engineering practice, pile/soil interaction analysis is usually undertaken within the framework of a serviceability limit state (SLS) design, the pile deflection being either measured from a full-scale loading test or computed based on a variety of methods, such as elasticity-based methods (Banerjee & Davis, 1978; Budhu & Davies, 1987; Randolph, 1981; Poulos & Hull, 1992), numerical methods (Hacouari & Bouafia, 2019; Khedija et al, 2020) and the P-Y curve methods (Matlock & Reese, 1960; Ménard et al., 1969; Baguelin et al, 1978; Reese & van Impe, 2001; Briaud, 2013).

In some particular pile/soil configurations (offshore

structures, monopiles of wind turbines, ... etc.) working under severe lateral loading conditions, an ultimate limit state (ULS) design should be carried out involving the lateral soil resistance (Ménard, 1969; Reese et al., 1974; Reese & van Impe, 2001).

It is nowadays recognized in engineering practice that the methods based on P-Y curves' concept offer a powerful framework to the analysis of the pile response under lateral load, with the advantage to account for the non-homogeneous distribution of the soil properties and the non-linear response of the pile/soil system. According to the P-Y curves' theory, a series of non-linear springs along the pile is used to model the pile/soil interface, where a spring subjected to the soil reaction P , at a given depth, exhibits a lateral displacement Y . A typical P-Y curve is depicted in Figure 1, where the main parameters are the initial reaction modulus E_{pi} and the lateral soil resistance P_u . According to the experience of full-scale lateral loading tests of piles, the shape of such a curve is usually non-linear and characterized by an initial linear portion corresponding to small pile deflections, as well as by a non-linear portion followed by a horizontal segment BC describing the soil failure around the pile.

Analysis of Pile Foundations Subject to Static and Dynamic Loading Amir M. Kaynia, 2021-08-30 This book presents computational tools and design principles for piles used in a wide range of applications and for different loading conditions. The chapters provide a mixture of basic engineering solutions and latest research findings in a balanced manner. The chapters are written by world renowned experts in the field. The materials are presented in a unified manner based on both simplified and rigorous numerical methods. The first four chapters present the basic elements and steps in analysis of piles under static and cyclic loading together with clear references to the appropriate design regulations in Eurocode 7 when relevant. The analysis techniques cover conventional code based methods, solutions based on pile soil interaction springs and advanced 3D finite element methods. The applications range from conventional piles to large circular steel piles used as anchors or monopiles in offshore applications. Chapters 5 to 10 are devoted to dynamic and earthquake analyses and design. These chapters cover a range of solutions from dynamic pile soil springs to elasto dynamic solutions of large pile groups. Both linear and nonlinear soil behaviours are considered along with response due to dynamic loads and earthquake shaking including possible liquefaction. The book is unique in its unified treatment of the solutions used for static and dynamic analysis of piles with practical examples of application. The book is considered a valuable tool for practicing engineers, graduate students and researchers. *Géotechnique*, 2009 *Proceedings of GeoShanghai 2018 International Conference: Multi-physics Processes in Soil Mechanics and Advances in Geotechnical Testing* Liangbo Hu, Xiaoqiang Gu, Junliang Tao, Annan Zhou, 2018-05-03 This book is the second volume of the proceedings of the 4th GeoShanghai International Conference that was held on May 27-30, 2018. Utilising a consistent approach encompassing new mathematical models, it offers solutions presented as closed form expressions and underpinned by the same set of 3-5 measurable soil input parameters. These focus on nonlinear response of mono piles, anchored piles, pile groups and torsional piles as well as passive piles subjected to soil

movement induced in shearing sliding slopes or excavation and earthquake shaking The models can also be used for pipelines and similar beam structures Solutions are provided in the form of design charts with each parameter obtained using available test data and illustrated with real world cases The models reveal for the first time the mysterious mechanisms of amplification resulting from back rotation which have incurred the collapse of structures such as the Showa Bridge and Nicoll Highway as well as the distortion of piles during earthquakes Advanced Design of Pile Foundations Under Lateral Loading is ideal for practicing foundation engineers and students at graduate level Wei Dong Guo is co founder of Hans Innovation Group and former Associate Professor at the University of Wollongong Australia He is a Chartered Professional Engineer and is a Fellow of Engineers Australia by whom he was awarded the 2012 Warren Medal

Single Piles and Pile Groups Under Lateral Loading Lymon C. Reese, William F. Van Impe, 2010-12-15 The complexities of designing piles for lateral loads are manifold as

there are many forces that are critical to the design of big structures such as bridges offshore and waterfront structures and retaining walls The loads on structures should be supported either horizontally or laterally or in both directions and most structures have in common that they are founded on piles To create solid foundations the pile designer is driven towards finding the critical load on a certain structure either by causing overload or by causing too much lateral deflection This second edition of Reese and Van Impe's course book explores and explains lateral load design and procedures for designing piles and pile groups accounting for the soil resistance as related to the lateral deflection of the pile It addresses the analysis of piles of varying stiffness installed into soils with a variety of characteristics accounting for the axial load at the top of the pile and for the rotational restraint of the pile head The presented method using load transfer functions is currently applied in practice by thousands of engineering offices in the world Moreover various experimental case design examples including the design of an offshore platform pile foundation are given to complement theory The rich list of relevant publications will serve the user into further reading Designed as a textbook for senior undergraduate graduate student courses in pile engineering foundation engineering and related subjects this set of book and CD ROM will also benefit professionals in civil and mining engineering and in the applied earth sciences

Foundation Engineering Handbook Hsai-Yang Fang, 2013-06-29 More than ten years have passed since the first edition was published During that period there have been a substantial number of changes in geotechnical engineering especially in the applications of foundation engineering As the world population increases more land is needed and many soil deposits previously deemed unsuitable for residential housing or other construction projects are now being used Such areas include problematic soil regions mining subsidence areas and sanitary landfills To overcome the problems associated with these natural or man made soil deposits new and improved methods of analysis design and implementation are needed in foundation construction As society develops and living standards rise tall buildings transportation facilities and industrial complexes are increasingly being built Because of the heavy design loads and the complicated environments the traditional design concepts construction materials methods and equipment also need improvement Further recent energy and material shortages have caused additional burdens on the engineering profession and brought about the need to seek alternative or cost saving methods for foundation design and construction
