Recent developments in electronically controlled systems for automobiles are focused on providing for soft magnetic parts that can provide a large electromagnetic flux with low electric power. New parts with very low carbon content have been developed in consideration of this soft electromagnetic properties such as cold crystallization and permeability. This paper describes the recent development trends of soft magnetic steel and the achievement of new developed steel (JIS G 3022 series).

Introduction

Recently automobiles are being heavily equipped with various systems operated electrically, electronically and/or electromechanically to control engine, gearbox and fuel economy. Such systems include integrated controlled automatic transmission, electronic power steering (EPS) and anti-lock braking systems (ABS)¹⁻³.

In the early years (1970s, 1980s) when electric and electronic devices started to be used in automobiles, the main purpose was to improve and upgrade the performance of individual systems. Highly complicated vehicles started to appear from then on, however, as integrating various high-speed linkage and movement coordinated among different systems. Hence electronically and/or electromechanically controlled management are becoming increasingly important.

Among these electronically and/or electromechanically controlled systems, components that utilize electromagnetic force (perpetuate low loss in their coils to generate magnetic fields, when conventional ones consist of low carbon steel, containing about 0.05% of carbon), to improve the response to control signals and increase energy efficiency.⁴⁻⁶ With the remarkable advancement of electromagnetic control in recent years, it has become essential for electromagnetic components to have even higher performance and lower power consumption.

This paper describes the trend of soft magnetic materials, such as those for low loss cores used in electromagnetic components, and introduces the characteristics of the new, low-loss soft magnetic materials in the JIS G 3022 (Ultra Low Carbon Cold Heading Steel) series developed by New Steel.

by hydraulic control. This is a typical example of the electromagnetic components used in automobiles. Soft magnetic materials are usually used for these cores that have magnetic circuits and for the housings including cores.

Early solenoid devices for automobiles were mainly used for controlling the oil flow by small sections. Thus, the reliability and workability of low cost materials were more important than their magnetic characteristics. As a result, low carbon steels such as SAE 1008, JIS G 3008, SAE 1010 and SAE 1015 (JIS G 3015) were used for the cores.⁷⁻⁹

Recent solenoid devices, however, must be able to convert hydraulic energy into static. In other words, the small control is being replaced by larger control in many cases.¹⁰⁻¹² On the other hand, the control current must be proportional to the driving force (electromagnetic force) of the low cores, which increases with magnetic materials having low coercivity (low hysteresis) at high flux density. The latest low loss cores maintain the same reliability as required to have magnetic characteristics better than those of SAE 1015 (JIS G 3015), making it difficult for low carbon steel formerly used for small control, to satisfy the required characteristics of magnetic materials and coercivity (Fig. 2).

In the mid-1980s, New Steel worked to totally eliminate factors that can adversely affect the magnetic characteristics of soft magnetic materials and developed a soft magnetic material, JIS G 3022 (low loss steel), which can achieve the best characteristics among 98 grade (90-94% of maximum). The company has studied parts having using a forging process and parts fabrication from the material is being widely used as a soft magnetic material for cold forging.

In the late 1990s, there was an increasing need for
