electronic engine ing and computer science Whether we are engaged in research into soft ha ware or hard software seems to be primarily a question of perspective What is unquestionable is that the interaction of groups of researchers from di erent backgrounds results in stimulating and productive research As we prepare for the new millennium the premier European forum for searchers in eld programmable logic remains the FPL workshop Next year the FPL series of workshopswill celebrate its tenth anniversary The contribution of so many overseas researchers has been a particularly attractive feature of these events giving them a truly international perspective while the informal and convivial atmosphere that pervades the workshops have been their hallmark We look forward to preserving these features in the future while continuing to expand the size and quality of the events **Real-time Systems** Kuodi Jian,2016-06-08 This book is dedicated to Real time Systems of broad applications such as autonavigation Kalman Filtering real time reconfiguration of distributed networks real time bilateral teleoperation control system over imperfect networks and uniform interfaces for resource sharing components in hierarchically scheduled real time systems In addition to that wireless technology and its usage in implementing intelligent systems open a wide spectrum of real time systems and offer great potential for improving people s life for example wireless sensor networks used in subways reduced energy consumption in public buildings improved security through public surveillance and high efficiency through industrial automation Furthermore electric utilities and multi core CPU architecture the driving force of modern life are part of subjects benefited from the topics covered in this book **Ultra-Low-Voltage Design of Energy-Efficient Digital Circuits** Nele Reynders,Wim Dehaene,2015-04-14 This book focuses on increasing the energy efficiency of electronic devices so that portable applications can have a longer stand alone time on the same battery The authors explain the energy efficiency benefits that ultra low voltage circuits provide and provide answers to tackle the challenges which ultra low voltage operation poses An innovative design methodology is presented verified and validated by four prototypes in advanced CMOS technologies These prototypes are shown to achieve high energy efficiency through their successful functionality at ultra low supply voltages **Design and Test Technology for Dependable Systems-on-Chip** Ubar, Raimund,Raik, Jaan,Vierhaus, Heinrich Theodor,2010-12-31 This book covers aspects of system design and efficient modelling and also introduces various fault models and fault mechanisms associated with digital circuits integrated into System on Chip SoC Multi Processor System on Chip MPSoC or Network on Chip NoC **Mathematics in Berlin** Heinrich Begehr,Helmut Koch,Jürg Kramer,Norbert Schappacher,Ernst-Jochen Thiele,1998-07-21 This little book is conceived as a service to mathematicians attending the 1998 International Congress of Mathematicians in Berlin It presents a comprehensive condensed overview of mathematical activity in Berlin from Leibniz almost to the present day without however including biographies of living mathematicians Since many towering figures in mathematical history worked in Berlin most of the chapters of this book are concise biographies These are held together by a few survey articles presenting the overall development of entire periods of scientific life at Berlin Overlaps between various chapters and differences in

style between the chap ters were inevitable but sometimes this provided opportunities to show different aspects of a single historical event for instance the Kronecker Weierstrass con troversy The book aims at readability rather than scholarly completeness There are no footnotes only references to the individual bibliographies of each chapter Still we do hope that the texts brought together here and written by the various authors for this volume constitute a solid introduction to the history of Berlin mathematics **Extreme Low-Power Mixed Signal IC Design** Armin Tajalli,Yusuf Leblebici,2010-09-14 Design exibility and power consumption in addition to the cost have always been the most important issues in design of integrated circuits ICs and are the main concerns of this research as well Energy Consumptions Power dissipation P and energy consumption are diss pecially importantwhen there is a limited amountof power budgetor limited source of energy Very common examples are portable systems where the battery life time depends on system power consumption Many different techniques have been veloped to reduce or manage the circuit power consumption in this type of systems Ultra low power ULP applications are another examples where power dissipation is the primary design issue In such applications the power budget is so restricted that very special circuit and system level design techniquesare needed to satisfy the requirements Circuits employed in applications such as wireless sensor networks WSN wearable battery powered systems 1 and implantable circuits for biol ical applications need to consume very low amount of power such that the entire system can survive for a very long time without the need for changingor recharging battery 2 4 Using newpowersupplytechniquessuchas energyharvesting 5 and printable batteries 6 is another reason for reducing power dissipation Devel ing special design techniques for implementing low power circuits 7 9 as well as dynamic power management DPM schemes 10 are the two main approaches to control the system power consumption Design Flexibility Design exibility is the other important issue in modern in grated systems Custom Memory Management Methodology Francky Catthoor,Sven Wuytack,G.E. de Greef,Florin Banica,Lode Nachtergaele,Arnout Vandecappelle,2013-03-09 The main intention of this book is to give an impression of the state of the art in system level memory management data transfer and storage related issues for complex data dominated real time signal and data processing applications The material is based on research at IMEC in this area in the period 1989 1997 In order to deal with the stringent timing requirements and the data dominated characteristics of this domain we have adopted a target architecture style and a systematic methodology to make the exploration and optimization of such systems feasible Our approach is also very heavily application driven which is illustrated by several realistic demonstrators partly used as red thread examples in the book Moreover the book addresses only the steps above the traditional high level synthesis scheduling and allocation or compilation traditional or ILP oriented tasks The latter are mainly focussed on scalar or scalar stream operations and data where the internal structure of the complex data types is not exploited in contrast to the approaches discussed here The proposed methodologies are largely independent of the level of programmability in the data path and controller so they are valuable for the realisation of both hardware and software

systems Our target domain consists of signal and data processing systems which deal with large amounts of data
