Rajendran, Dr. R. Krishnaraj, *The Changing Global Environment* S.F. Singer, 2012-12-06 We know a great deal about historical climate and its variations from various geological studies There are two points worth remarking on One is that the climate changes frequently and radically but that the degree of variation and even sense of variation depends on the time scale which we are considering Secondly that this is a most unusual geological period for the Planet Earth we are living in a period of mountain building and glaciations whereas during most of the last 250 million years there was little ice and little topography A good view of climate change of the last hundred years can be gained by looking at the paper of Kellogg We are now in a period of extensive glaciations The previous interval occurred 300 to 250 million years ago when even the Sahara was glaciated Of course it was at that time near the position of the South Pole we know that 300 million years ago the continents had not broken apart and formed one land mass Apparently between 250 and 20 million years ago there was little ice on the Earth even at Antarctica Continental basins were flooded by shallow seas This was the period when plant life and marine life proliferated and when most of our fossil fuels were laid down
