Design of a Chemical Plant for the Production of 525, 600 Ton/yr of Low Density Polyethylene Mariam Aljaberi, 2019 Low density of polyethylene is a thermoplastic model made from the long chain of ethylene and it is one of the categories of polyethylene which classified based on the density and branching Low density of polyethylene is widely used in several applications such as film applications containers and plastic bags In addition it is mainly used as a laboratory apparatus and electrical insulation products On an industrial area low density of polyethylene can be produced from the reaction of ethylene that occurs on either auto clave process or tubular process The main objective of this research is to design a plant that produces 525 600 tons year of low density of polyethylene from the raw materials which is ethylene The quantities of ethylene consumed in the process was 65 545 kg hr In the first step of the process ethylene is compressed in three stages before it enters the reactor as well as the hyper compressor This study evaluates two main processes of producing low density of polyethylene on a large scale The selected process which is tubular process was better than autoclave regarding the factors that have been studied in this project Such as economy analysis features of designing and the molecular weight distribution Moreover the specific selection was on Tubular process of Borouge company that the process is most sustainable and economically viable one which could meet the growing needs in the UAE The design of the process flow diagram is carried out in different stages Initially compression of ethylene gas in three stages then polymerization in tubular reactor which an important equipment in our process which the final products is formed with 25% conversion are needed for the principal reaction for production of low density of polyethylene Farther polymer gas separation and unreacted gas recycle step extrusion and degassing which is the final step of the whole process Ethylene Production by Oxidative Coupling of Methane Xuan Son Nghiem, 2014 **Polyethylene Film Extrusion** B. H Gregory, 2009-11 A revised version of this book is now available The polyethylene industry has been in the midst of major restructuring and rationalization This has lead to joint ventures and alliances to combine technologies and exploit opportunities to maximize improvements in process productivity catalyst innovations and enhancements in extrusion technology and converting This comprehensive study of the polyethylene film extrusion process describes this technology in detail In depth descriptions of the manufacturing processes for polyethylene homopolymers and copolymers including metallocenes are reviewed All aspects of machine design with particular emphasis on screws and dies including coextrusion are discussed comprehensively With computer modeling the interactions between equipment and polymer are quantified All aspects of equipment design and polymer features that control melt fracture interfacial instabilities gauge control output and temperature and cooling of blown and cast film

processes are presented quantitatively This methodology will highlight solutions in troubleshooting for optimum design and operation and the best available polymer and formulation choices All polyethylene film applications in packaging agriculture lamination and construction consumer industrial and health care are reviewed and discussed in depth
