

1. Given the points:  $A(105, 20, 75)$  and  $B(40, 40, 30)$  defining the line  $(D)(d, d')$ , determine the true length of the line segment  $(AB)(ab, a'b')$ , using the projection planes changing method.

 **SOLUTION**

In order to determine the true length of the segment  $(AB)$ , it is necessary that it has a certain position relative to one of a projection planes, so that it is projected on this plane, without deformation. In this case, we consider the segment  $(AB)$  parallel to a new vertical plane  $[V_1] \perp [H]$ , the new projection axis  $\{O_1X_1\}$  being parallel to the projection  $(ab)$ . Hence, the line  $(D) (d, d')$  turned into a frontal line by changing of vertical plane.

In the draught, the new projection axis  $\{O_1X_1\} \parallel \{d\}$  is drawn first. Then, in order to obtain the vertical projections  $a_1'$  and  $b_1'$ , from  $a \equiv a_1$  and  $b \equiv b_1$  we draw the lines perpendicular to the new axis, keeping the elevations of these points. The vertical projection  $(a_1'b_1')$  represents the true length of the line  $(AB)$ .

2. Given the points:  $A(40, 10, 100)$  and  $B(110, 40, 0)$  defining the line  $(D)(d, d')$ , determine the true length of the line segment  $(AB)(ab, a'b')$ , using the revolution method.

**Problems in Descriptive Geometry** George Miller Bartlett, 2015-06-25 Excerpt from Numerical Problems in Descriptive Geometry For Class and Drawing Room Practice 1 The distance of a point from the H plane is the distance of its V projection from the ground line The distance of a point from the V plane is the distance of its H projection from the ground line 2 If any two projections of a point are given the point is fully determined and the third projection may be found from the above principle 3 If a line is parallel to either plane of projection its projection upon the other plane of projection is parallel to the ground line 4 If a line is parallel to either plane of projection it will be projected upon that plane in its true length 5 If two intersecting lines are each parallel to the same plane of projection the angle between the lines will be projected upon that plane in its true magnitude 6 If a point lies in a given line its projections will lie in the corresponding projections of the line 7 If two lines are parallel in space their corresponding projections are parallel 8 The H and V traces of a plane always intersect the ground line at the same point 9 If any two traces of a plane are given the plane is fully determined 10 If a plane is parallel to the ground line its traces are parallel to the ground line and conversely 11 If a plane is perpendicular to either plane of projection its trace upon the other plane is perpendicular to the ground line and conversely 12 If a line lies in a given plane its H piercing point lies in the H trace of the plane and its V piercing point lies in the V trace of the plane About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at [www.forgottenbooks.com](http://www.forgottenbooks.com) This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

*Descriptive Geometry* William S. Hall,2015-06-24 Excerpt from Descriptive Geometry With Numerous Problems and Practical Applications The text books on Descriptive Geometry with very few exceptions deal only with first angle projection But in the best recent practice in mechanical drawing the third angle is used The third angle is also commonly employed in perspective It would seem to be desirable then not to confine the student exclusively to the use of any one angle In this book all four angles are used Thus the problems become general and a large variety of constructions may be introduced under each problem By having the problems for construction put in a separate volume and by having several modifications under each problem blackboard work can be readily assigned to the members of a class in recitation and no two students need be given exactly the same work If the student is required to be prepared to make the construction for each problem under all possible conditions a thorough understanding of the problem is necessary A large number of carefully arranged problems and some practical applications are given The first few problems on the point line and plane are fully analyzed Then follows a list of problems left to the student for solution In the part of the book devoted to curves and curved surfaces more problems are analyzed and fewer are left to the student to solve without assistance The importance of the study of Descriptive Geometry both for mental discipline and on account of its industrial utility is very ably set forth in two quotations that are given at the end of the introductory chapter About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic

**A Manual of Descriptive Geometry with Numerous Problems** Clarence A. Waldo, 2017-09-24 From the INTRODUCTION How can a solid having three dimensions be exactly represented upon a surface having but two dimensions This is the problem which Descriptive Geometry seeks to answer As the theoretical basis of its answer it develops certain laws of relationship which connect the figure in space with its expression in a plane These laws belong to Projective Geometry and are rigorously mathematical when however actual representations of real objects are attempted the results will be approximations of varying degrees of accuracy according to the skill of the artist Descriptive Geometry is an art when it exercises a student in its methods a science when it reveals a strictly mathematical basis for its methods To the technologist as the architect or mechanic it is not only necessary that the representation should be derived from the original and suggest it in a general way but it is even more imperative that the original itself which may have been a material object or only a creation of the imagination may be reproduced by the skilled workman with the aid of the representation in tangible material form in every smallest detail of shape and measurement Because rectangular or orthographic projection accomplishes this twofold object best it has generally been allowed to usurp the whole domain of Descriptive Geometry and it is not the purpose of this little book to depart greatly from the usual though inadequate interpretation of the science For the sake of special descriptive properties easily understood the more general science of Projective Geometry is drawn upon for a few isolated propositions
