

Polymers

A polymer is a substance that is made up of very large molecules that are, in turn, made up of many repeating units called monomers. The term polymer in Greek means 'many parts'. Polymers can be found all around us. From the strand of our DNA which is a naturally occurring biopolymer to polypropylene which is used throughout the world as plastic.

Polymerization is the process through which the monomers come together to form the macromolecules that constitute polymers. An illustration detailing the polymerization of the monomer styrene into the polymer known as polystyrene is provided below.

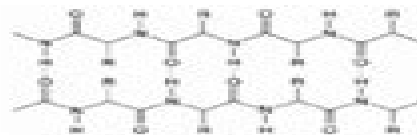

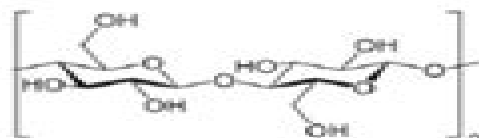

[Polystyrene is a hard, brilliantly transparent, stiff resin. Polystyrene is **insoluble in water**. Polystyrene is compound that is non-biodegradable with a couple of exceptions. It is easily dissolved by many aromatic hydrocarbon solvents and chlorinated solvents. It is widely used in the food-service industry as rigid trays, containers, disposable eating plates, bowls, etc.]

Classification of Polymers based on the Source

There are **three types of classification** under this category, namely, Natural, Synthetic, and Semi-synthetic Polymers.

Natural Polymers:

They occur naturally and are found in plants and animals. For example proteins, starch, cellulose, and rubber.
