Crop Pest Control and Pollination, volume II, 2nd edition Fang Ouyang,Xingyuan Men,Wen Xie,Wei Li,2023-12-01 The production of food crops helps us meet the basic need of human nutrition The world's population now exceeds 7 billion people and continues to grow Alongside this growth the human demand for food also increases rapidly Crop production is becoming increasingly intensive and large scale and as a result simplified landscape systems form Crop production in simplified agricultural landscapes often face or suffer from various threats such as pest damage caused by diseases insect pests weeds and rodents or a shortage of pollinators These pests can cause serious damage to seeds germination growth breeding and maturity during crop production and food storage however effective pest management can help to reduce crop loss Most crops in particular fruit trees and vegetables require insect pollination to ensure high yields and high quality Research into ecosystem services and their potential impact on pest control and pollination in agricultural landscapes is of great significance to sustainable crop production Simplified and intensive agricultural landscapes can support crop production but often have reduced biodiversity as monoculture cropping systems have limited surrounding natural habitat This lack of natural surrounding habitat leads to the loss of ecosystem service benefits such as natural pest control and pollination Over the past few decades pest control has largely relied on chemical pesticides which can control pests and reduce crop losses in the short term However chemical pesticides cause a number of problems in the long run for example pest resistance to pesticides and residues of pesticides in soil water and agricultural products Excessive improper and long term use of pesticides during crop production ultimately harms human health and biodiversity especially beneficial microbes natural enemies and pollinators To achieve and ensure food security food safety and ecological security new theories methods practice and application patterns need to be developed for environmentally friendly pest control and maintenance of pollination in agricultural landscapes for sustainable food production The aim of this Research Topic is to promote the sustainable management of crop production and ecological

environment protection through the discussion of crop pest control and pollination and the publication of original research articles and reviews of research and theory We welcome high quality and original contributions that present original papers on basic and applied research covering aspects of natural pest control and pollination Coverage for this Research Topic includes the biology and ecology of pollinators including wild and managed organisms including parasitoids invertebrate and vertebrate predators of insect pest and plants mites plant and insect pathogens nematodes and weeds used for biological control and aspects of use including biological control agents for integrated pest management on food crops fruits and vegetables in agricultural landscapes Natural pest control is an environmentally beneficial and effective means of reducing or mitigating pests and pest damage through the use of natural enemies Ecological ethological molecular and biotechnological approaches to the understanding of natural pest control and pollination in agricultural landscapes are welcome Such as by maintaining and increasing crop genetic diversity not including genetically engineered crops crop diversity species diversity not including genetically altered insects and landscape diversity in cropping systems The Vegetable Kingdom ... Second Edition, with Corrections and Additional Genera John Lindley, 1847 Ecosystems as Models for Restoring our Economies, 2nd Edition John H. Giordanengo, 2025-04-01 Emerging from the fields of ecological restoration and economics this interdisciplinary book delivers a clear path to restoring our economies in a way that speaks well to industry groups and business owners students and the general public and to policy makers There are proven relationships between ecology and economics Giordanengo employs those relationships in an intriguing way and integrates them with global case studies to argue that redesigning economic systems according to ecological principles is necessary to balancing critical social environmental and economic goals For example he reveals how more obscure ecological principles and theories succession evolution diversity productivity curves and so on can inform the restructuring of economic systems that are resilient productive and regenerative A variety of students and practitioners have read the first edition or attended John s seminars only to remark Why haven t we learned this in our traditional coursework or This book brings so much clarity to the fields of sustainability and environmental sciences Traditional approaches to sustainability focus on the social environmental and economic pillars of an economy while paying little attention to the foundation those pillars rest upon A comprehensive focus on our economy s foundational components has been ignored for good reason we have lacked an understanding of what they are or how they interact with one another Cross cutting research between ecological and economic systems reveals three foundational components i e drivers common to both systems The effective management of these components is perhaps the most important obstacle to resolving current tensions between society nature and the global market economy The scale at which diversity energy and trade must be managed is also justified by self regulating ecosystems such as jungles prairies and pine forests That scale is not global nor is it hyper local The economic and ecological rationale agree that the scale of a sustainable economy the natural geography of humans is regional To the contrary the attempt to manage our economy at a

global scale has given rise to chronic social environmental and economic symptoms across earth In highly developed countries such as the United States these symptoms include flat real wages and productivity growth a growing wealth gap degraded environmental conditions rising social unrest and more The closing chapters outline a natural path for restoring our economies illuminated by humanities shared experience in ecological restoration The process of ecosystem recovery following disturbance i e succession is one such pathway Unwittingly developed nations such as the United States manage succession to concentrate wealth into fewer hands while lowering the economy's productive capacity net productivity and resistance to future disturbances Economic policies can also move the succession dial toward the productive and diverse center where wealth and resources are recirculated quickly new business opportunities are created and resilience and resistance are fortified a stout shield in the face of global economic turmoil For policymakers consumers and industry groups this book explores root causes of the challenges you face so that you may take deep correct actions to yield lasting change Giordanengo provides critique but goes further with clear steps that individuals businesses communities and policymakers can take to start restoring our economies now From agricultural restoration to regional manufacturing and energy systems he outlines practical strategies and policy mechanisms for building regenerative economies Students will find not just theoretical and systems knowledge but applied economics ecology and conservation centered around actionable pathways Economic restoration is not only possible it is our humanitarian duty
