booknews com Risk-based Inspection Methodology ,2016 **Risk-based Inspection Methodology** ,2016 **Integrity management through risk based inspection** ,2005 Neste trabalho apresenta se um procedimento que envolve técnicas de inspeção baseada em risco IBR e adequada ao uso baseados nas recomendações API 581 e 579 respectivamente para gerenciar a integridade estrutural de equipamentos estáticos e tubulações sujeitos a perda de espessura por corrosão. O risco de falha de um equipamento analisado de forma quantitativa através do cálculo da probabilidade de falha PoF e da consequência de falha CoF. Uma visão geral da IBR e da análise de risco introduzida e seus objetivos vantagens e desvantagens são analisados. A deterioração da parede metálica de equipamentos sujeitos a corrosão causa um aumento da PoF ao longo do tempo. Esse aumento da PoF depende da taxa de dano, da qualidade da previsão da taxa e ainda da eficiência dos métodos de inspeção usados para detectar e quantificar essa taxa. A falha de um equipamento pode resultar em consequências tais como danos a equipamentos vizinhos, danos às pessoas, parada e perda de produção, contaminação do meio ambiente e danos à imagem da empresa. Com base nesse procedimento desenvolveu-se um programa para o gerenciamento da integridade de equipamentos. Com o programa possível estabelecer um plano de inspeção para o equipamento levando-se em conta a eficiência dos métodos de inspeção com o objetivo de manter o equipamento abaixo de um risco de falha dado como admissível. Apresenta-se então um exemplo de aplicação no qual um vaso separador de óleo e gás está sujeito a corrosão interna e corrosão externa. A PoF e a CoF do equipamento são calculadas de forma quantitativa. Um plano para realização de inspeções é proposto sempre se respeitando os prazos mínimos estabelecidos pela NR 13 considerando-se a eficiência da inspeção interna, externa e teste hidrostático adequada para detecção e acompanhamento do mecanismo de dano por corrosão interna e corrosão externa atmosférica atuante no vaso. Verifica-se então que com o plano proposto consegue-se controlar o risco de falha possibilitando assim um melhor aproveitamento dos recursos de inspeção verificados também se o vaso na época da inspeção estiver adequado ao uso nas condições de operação estabelecidas.
