Genetics, Heredity & Evolution: shared, conserved, fundamental processes and features support the concept of **--common ancestry--** for all organisms. *(Much of the information below will be supported in future units - this is the big picture showing the connections between DNA and evolution, not in text, added in)*

1. These processes and features provide **-evidence-** that all organisms (Archaea, Bacteria, and Eukarya) both extant and extinct, are linked by **-lines of descent-** from common ancestry.
 - a. DNA and RNA are carriers of **-genetic information-** information: the proper storage and transfer of this information are critical for life to continue at the cell, organism and species level
 - i. Non-eukaryotic chromosomes are **circular**, eukaryotic organisms have multiple linear chromosomes.
 - ii. **-Ribosomes-** are found in all forms of life
 - iii. Viruses have RNA or DNA
 - iv. DNA is **-interchangeable-** between living organism - it can be moved from one organism to another
 - b. A universal genetic **-code-**: A, T, G, C, U are the nitrogenous bases found in all living organisms. The CENTRAL DOGMA of genetics states that in ALL life (conserved mechanisms):
 - i. DNA replication ensures the **continuity** of hereditary information
 - ii. Genetic information flows from **-nucleotides-** in a gene to a **-sequence of amino acids--** in a protein (transcription & translation)
 - iii. Phenotypes are determined through **-protein activities--**
 - c. Metabolic pathways: ATP (energy).
