

Chapter 39: Plant Responses to Internal and External Signals

Concept 39.1 Signal transduction pathways link signal reception to response

This concept brings together the general ideas on cell communication from Chapter 11 with specific examples of signal transduction in plants. As with animals, plants have receptors that trigger signal transduction pathways when activated. Let's begin with a review of three steps in signal transduction.

Step 1: Reception. Cell signals are detected by receptors that undergo changes in shape in response to a specific stimulus.

Step 2: Transduction. Transduction is a multistep pathway that amplifies the signal. This effect allows a small number of signal molecules to produce a large cellular response.

Step 3: Response. Cellular response is primarily accomplished by two mechanisms:

- increasing or decreasing mRNA production
- activating existing enzyme molecules

- Have you ever seen a shrivelled potato sending out skinny, pale sprouts? What is this called?
- If you move the potato into the light, the sprout will respond by forming short, sturdy stems and broad, green leaves. What is this response to light called?
- The figure below gives a specific example of a signal transduction in plants for the *growing or de-etiolation* response described above. Label these parts of the figure: reception, transduction, response, phytochrome, signal, Ca^{2+} channel, second messenger (cGMP), protein kinase, transcription factor, and DNA.

Selected Topics in Environmental Biology Balraj Bhatia, G. S. Chhina, Baldev Singh, 2013-10-22 Selected Topics in Environmental Biology covers the proceedings of the 26th International Congress of Physiological Sciences on Environmental Biology held in New Delhi India on October 20-26, 1974. The symposium is arranged in the subjects of high altitude and under water physiology and the physiological effects of cold, heat, and accelerations. This book is organized into 13 sections encompassing 74 chapters. The opening part deals with the principles and mechanisms of thermoregulation with emphasis on the role of neurotransmitters in temperature regulation. The succeeding parts examine metabolic aspects and adaptive mechanisms to cold and heat stress. These parts also survey the thyroid function, resistance to acclimatization, and nerve impulse effects of these conditions. Other parts discuss the hypothalamic control and susceptibility to hypothermia and thermal injury, the capacity of short term and prolonged exposure to hypoxia, the pathogenesis of pulmonary edema, and the constitution and body functions in different ethnic groups. These topics are followed by reviews on the body's adaptive changes under hypogравic state, biochemical changes induced by environmental pollution, and physiological behavior under noise, hyperbaric, and emotional stress. The last part describes the effect of environmental stress on diurnal variations in body functions. This book will prove useful to environmental biologists, physiologists, biochemists, and researchers.

Stem Cell Biology and Tissue Engineering in Dental Sciences Ajaykumar Vishwakarma, Paul Sharpe, Songtao Shi, Murugan Ramalingam, 2014-11-05 Stem Cell Biology and Tissue Engineering in Dental Sciences bridges the gap left by many tissue engineering and stem cell biology titles to highlight the significance of translational research in this field in the medical sciences. It compiles basic developmental biology with keen focus on cell and matrix biology, stem cells with relevance to tissue engineering, biomaterials including nanotechnology, and current applications in various disciplines of dental sciences viz. periodontology, endodontics, oral craniofacial surgery, dental implantology, orthodontics, dentofacial orthopedics, organ engineering, and transplant medicine. In addition, it covers research ethics, laws, and industrial pitfalls that are of particular importance for the future production of tissue constructs. Tissue Engineering is an interdisciplinary field of biomedical research which combines life engineering and materials sciences to progress the maintenance, repair, and replacement of diseased and damaged tissues. This ever-emerging area of research applies an understanding of normal tissue physiology to develop novel biomaterial, acellular, and cell-based technologies for clinical and non-clinical applications. As evident in numerous medical disciplines, tissue engineering strategies are now being increasingly developed and evaluated as potential routine therapies for oral and craniofacial tissue repair and regeneration. Diligently covers all the aspects related to stem cell biology and tissue engineering in dental sciences: basic science research, clinical application, and commercialization. Provides detailed descriptions of new modern technologies, fabrication techniques employed in the fields of stem cells, biomaterials, and tissue engineering research, including details of latest advances in nanotechnology. Includes a description of stem cell biology with
