## Rules for Means of RV

1.  $\mu_{a+bx} = a + b\mu_x$

- If you perform a linear transformation on every data point, the mean will change according to the same formula.

2.  $\mu_{X+Y} = \mu_X + \mu_Y$

- If you combine two variables into one distribution by adding or subtracting, the mean of the new distribution can be calculated using the same operation.

## Rules for Variances of RV

1.  $\sigma^2_{a+bx} = b^2\sigma^2_x$

2.  $\sigma^2_{X+Y} = \sigma^2_X + \sigma^2_Y$

$\sigma^2_{X-Y} = \sigma^2_X + \sigma^2_Y$

- X and Y must be Independent!

## Application [Expected Value]

You own a very rare painting that is worth \$15,000 and you are insuring it through a popular insurance company used throughout the art community. You pay the insurance company \$220 annually to insure your painting under the following circumstances:

- if the painting is stolen, the company will cover the full value of the piece.
- if the painting is damaged, the company will cover 1/3 of the value.

Based on empirical probability, the company states that the probability of the painting getting stolen is 0.001 and the probability that the painting will be damaged is 0.02.

1. What is the expected long-run value of this business deal for the insurance company? Is it a good deal for them?
2. What is the standard deviation for the value of this business deal for the insurance company?

	<u>stolen</u>	<u>damaged</u>	<u>not damaged</u>
X	14780	-2200	220
P(x)	0.001	0.02	0.979

$$E(x) = \sum x_i \cdot p_i = \$55$$

$$\sigma_x = \$1150.12$$

branch of experimental science after passing through an early stage of qualitative description concerns itself with quantitative studies of the phenomena of interest i.e measurements In addition to designing and carrying out the experiment an important task is the accurate evaluation and complete exploitation of the data obtained Let us list a few typical problems 1 A study is made of the weight of laboratory animals under the influence of various drugs After the application of drug A to 25 animals an average increase of 5 % is observed Drug B used on 10 animals yields a 3 % increase Is drug A more effective The averages 5 % and 3 % give practically no answer to this question since the lower value may have been caused by a single animal that lost weight for some unrelated reason One must therefore study the distribution of individual weights and their spread around the average value Moreover one has to decide whether the number of test animals used will enable one to differentiate with a certain accuracy between the effects of the two drugs 2 In experiments on crystal growth it is essential to maintain exactly the ratios of the different components From a total of 500 crystals a sample of 20 is selected and analyzed
