B.

Answer:

C.

Answer:

An outlier is any value that lies more than 1.5 IQRs below the lower quartile or more than 1.5 IQRs above the upper quartile (here, we are only interested in values above the upper quartile). The IQR is  $54.5 - 31 = 23.5$ . Thus we get  $1.5 \cdot 23.5 = 35.25$ . We then find that  $1.5 (\text{IQR}) + (\text{upper quartile}) = 35.25 + 54.5 = 89.75$ . So any value above 89.75 would be considered an outlier. Thus 89 is the largest possible value that would **not** be an outlier.

2.

A.

Answer:

It was an observational study. The groups were not randomized, nor was any treatment imposed by the researchers. The behavior of two different groups was observed and results were recorded.

B.

Answer:

The groups may have been self-selected. It's possible that the group that chose to take the training was composed of students who were better at math, on average, than those who chose not to take the training. That is, the discrepancy in the final exam scores could be the result of differences in the math ability of the two groups.

C.

Answer:

A Type II error occurs when you mistakenly accept a false hypothesis. If something besides the training (such as bias through self-selection) caused the differences in scores, then the administration is operating under a false hypothesis. Thus, in this scenario, one risk of a Type II error is the allocation of resources to a program that may not result in any improvements. Another risk of a Type II error is that there may be no further research into finding an effective way to increase girls' math scores.
