Gustafson, 1999-01-01 This volume offers an excellent undergraduate level introduction to the main topics methods and applications of partial differential equations Chapter 1 presents a full introduction to partial differential equations and Fourier series as related to applied mathematics Chapter 2 begins with a more comprehensive look at the principal method for solving partial differential equations the separation of variables and then more fully develops that approach in the contexts of Hilbert space and numerical methods Chapter 3 includes an expanded treatment of first order systems a short introduction to computational methods and aspects of topical research on the partial differential equations of fluid dynamics With over 600 problems and exercises along with explanations examples and a comprehensive section of answers hints and solutions this superb easy to use text is ideal for a one semester or full year course It will also provide the mathematically inclined layperson with a stimulating review of the subject s essentials     *Handbook of Computability and Complexity in Analysis* Vasco Brattka, Peter Hertling, 2021-06-04 Computable analysis is the modern theory of computability and complexity in analysis that arose out of Turing s seminal work in the 1930s This was motivated by questions such as which real numbers

and real number functions are computable and which mathematical tasks in analysis can be solved by algorithmic means. Nowadays this theory has many different facets that embrace topics from computability theory, algorithmic randomness, computational complexity, dynamical systems, fractals, and analog computers up to logic, descriptive set theory, constructivism, and reverse mathematics. In recent decades, computable analysis has invaded many branches of analysis, and researchers have studied computability and complexity questions arising from real and complex analysis, functional analysis, and the theory of differential equations up to geometric measure theory and topology. This handbook represents the first coherent cross section through most active research topics on the more theoretical side of the field. It contains 11 chapters grouped into parts on computability in analysis, complexity, dynamics and randomness, and constructivity, logic, and descriptive complexity. All chapters are written by leading experts working at the cutting edge of the respective topic. Researchers and graduate students in the areas of theoretical computer science and mathematical logic will find systematic introductions into many branches of computable analysis and a wealth of information and references that will help them to navigate the modern research literature in this field.
