**Understanding Changes in Poverty** Gabriela Inchauste, João Pedro Azevedo, B. Essama-Nssah, Sergio Olivieri, Trang Van Nguyen, Jaime Saavedra-Chanduvi, Hernan Winkler, 2014-08-21 The 2015 Millennium Development Goal to cut in half the share of the world's population living in extreme poverty was met with time to spare By 2013 the percentage of developing country populations living in extreme poverty decreased from 43 percent in 1990 to 21 percent by 2010 Clearly there is still a long way to go with 1.2 billion people without enough to eat What can we learn from the recent success This volume presents recent methods to decompose the contributions to poverty reduction What was the main contributor to poverty reduction Using a simple accounting approach we find that labor income growth was the largest contributor to moderate poverty reduction for a group of 21 countries with substantial reductions in poverty over the past decade Moreover in most cases it was the growth in income per worker that contributed the most to poverty reduction rather than an increase in employment Changes in demographics public transfers and remittances helped but made relatively smaller contributions to poverty reduction Public transfers were important in reducing extreme poverty pointing to the crucial role of social protection systems How was labor income growth able to reduce poverty After a review of the literature a structural decomposition method is presented and implemented in three countries The results show that that labor income grew mainly because of higher returns to human capital endowments This could signal increases in productivity a higher relative price of labor or both In Bangladesh and Peru this was driven by higher returns to workers with low levels of education which may have partly been driven by higher food prices In contrast in Thailand poverty fell partly due to increasing returns to education
