Frank O'Brien,2010-06-25 The technological marvel that facilitated the Apollo missions to the Moon was the on board computer In the 1960s most computers filled an entire room but the spacecraft s computer was required to be compact and low power Although people today find it difficult to accept that it was possible to control a spacecraft using such a primitive computer it nevertheless had capabilities that are advanced even by today s standards This is the first book to fully describe the Apollo guidance computer s architecture instruction format and programs used by the astronauts As a comprehensive account it will span the disciplines of computer science electrical and aerospace engineering However it will also be accessible to the space enthusiast In short the intention is for this to be the definitive account of the Apollo guidance computer Frank O Brien s interest in the Apollo program began as a serious amateur historian About 12 years ago he began performing research and writing essays for the Apollo Lunar Surface Journal and the Apollo Flight Journal Much of this work centered on his primary interests the Apollo Guidance Computer AGC and the Lunar Module These Journals are generally considered the canonical online reference on the flights to the Moon He was then asked to assist the curatorial staff in the creation of the Cradle of Aviation Museum on Long Island New York where he helped prepare the Lunar Module simulator a LM procedure trainer and an Apollo space suit for display He regularly lectures on the Apollo computer and related topics to diverse groups from NASA s computer engineering conferences the IEEE ACM computer festivals and university student groups **Automating with STEP 7 in LAD and FBD** Hans Berger,2014-11-21 SIMATIC is the worldwide established automation system for implementing industrial control systems for machines manufacturing plants and industrial processes Relevant open loop and closed loop control tasks are formulated in various programming languages with the engineering software STEP 7 Ladder diagram LAD and function block diagram FBD use graphic symbols to display the monitoring and control functions similar those used in schematic circuit diagrams or electronic switching systems Now in its fifth edition this book describes these graphic oriented programming languages combined with the engineering software STEP 7 V5 5 for use with both SIMATIC S7 300 and SIMATIC S7 400 automation systems New functions of this STEP 7 version are especially related to CPU Webserver and PROFINET IO like for example the application of I devices shared devices and isochrone mode It is aimed at all users of SIMATIC S7 controllers First time users are introduced to the field of programmable controllers while advanced users learn about specific applications of the SIMATIC S7 automation system All programming examples found in the book and even a few extra examples are available over the publisher s website under Downloads **Restarting Automata** Friedrich Otto,2025-03-14 The subject of this monograph are restarting automata The definition of these automata is motivated by the linguistic technique of analysis by reduction This technique which can be used to analyze sentences in natural languages with a rather free word order like Czech or Latin or German consists of a sequence of step by step simplifications of a given sentence Each of these simplifications is realized by a single reduction operation which consists of either the deletion of one or several words from that sentence or the replacement of a possibly discontinuous

substring of that sentence by a shorter substring It is required that each application of such a reduction operation must preserve the syntactical correctness of the sentence Accordingly a restarting automaton consists of a finite state control a flexible tape that initially contains the input and a read write window of a fixed finite size that works on that tape The first type of restarting automaton was presented at the international conference FCT in 1995 This type was required to restart as soon as it executes a rewrite operation that is the window jumps back to the left end of the tape and the finite state control is reset to the initial state Moreover each rewrite operation simply deletes one or more letters from the contents of the read write window Subsequently many different variants of the restarting automaton have been defined and studied In particular proper length reducing rewrite operations have replaced the original delete steps additional non input letters called auxiliary letters have been added to the alphabet and the original combined rewrite restart operation has been split into a rewrite operation and a separate restart operation Thus the restarting automaton is no longer just a particular type of automaton but it has evolved into a whole family of various types of automata that are specified through several parameters The objective of the current monograph is to collect the many results that have been obtained on the various types of restarting automata in one place and to present them in a uniform and systematic way In particular the influence of the various parameters on the expressive capacity of the resulting types of restarting automata is studied in detail Other topics include the descriptional complexity and inductive inference of certain types of restarting automata cooperating distributed and parallel communicating systems of restarting automata restarting automata with output weighted restarting automata and restarting automata for picture languages and tree languages This monograph may serve as a book of reference for researchers working in formal language and automata theory as a guide to the literature on restarting automata and as a text book for an advanced undergraduate or graduate course in formal language and automata theory **System z Mean Time to Recovery Best Practices** Frank Kyne,Judi Bank,David Sanders,Mark Todd,David Viguers,Cheryl Watson,Shulian Yang,IBM Redbooks,2010-03-22 This IBM Redbooks publication provides advice and guidance for IBM z OS Version 1 Release 10 and subsystem system programmers z OS is an IBM flagship operating system for enterprise class applications particularly those with high availability requirements But as with every operating system z OS requires planned IPLs from time to time This book also provides you with easily accessible and usable information about ways to improve your mean time to recovery MTTR by helping you achieve the following objectives Minimize the application down time that might be associated with planned system outages Identify the most effective way to reduce MTTR for any time that you have a system IPL Identify factors that are under your control and that can make a worthwhile difference to the startup or shutdown time of your systems **ABRAC** W.
