**Microstrip Filters for RF / Microwave Applications** Jia-Sheng Hong, 2011-01-06 The first edition of Microstrip Filters for RF Microwave

Applications was published in 2001. Over the years the book has been well received and is used extensively in both academia and industry by microwave researchers and engineers. From its inception as a manuscript the book is almost 8 years old. While the fundamentals of filter circuits have not changed, further innovations in filter realizations and other applications have occurred with changes in the technology and use of new fabrication processes such as the recent advances in RF MEMS and ferroelectric films for tunable filters, the use of liquid crystal polymer LCP substrates for multilayer circuits as well as the new filters for dual band, multi band and ultra wideband UWB applications. Although the microstrip filter remains as the main transmission line medium for these new developments, there has been a new trend of using combined planar transmission line structures such as co planar waveguide CPW and slotted ground structures for novel physical implementations beyond the single layer in order to achieve filter miniaturization and better performance. Also over the years practitioners have suggested topics that should be added for completeness or deleted in some cases as they were not very useful in practice. In view of the above, the authors are proposing a revised version of the Microstrip Filters for RF Microwave Applications text and a slightly changed book title of Planar Filters for RF Microwave Applications to reflect the aforementioned trends in the revised book.
