Fundamental Solutions of Linear Partial Differential Operators Norbert Ortner, Peter Wagner, 2015-08-05 This monograph provides the theoretical foundations needed for the construction of fundamental solutions and fundamental matrices of systems of linear partial differential equations Many illustrative examples also show techniques for finding such solutions in terms of integrals Particular attention is given to developing the fundamentals of distribution theory accompanied by calculations of fundamental solutions The main part of the book deals with existence theorems and uniqueness criteria the method of parameter integration the investigation of quasihyperbolic systems by means of Fourier and Laplace transforms and the representation of fundamental solutions of homogeneous elliptic operators with the help of Abelian integrals In addition to rigorous distributional derivations and verifications of fundamental solutions the book also shows how to construct fundamental solutions matrices of many physically relevant operators systems in elasticity thermoelasticity hexagonal cubic elastodynamics for Maxwell's system and others The book mainly addresses researchers and lecturers who work with partial differential equations However it also offers a valuable resource for students with a solid background in vector calculus complex analysis and functional analysis

Optimal Control and Viscosity Solutions of Hamilton-Jacobi-Bellman Equations Martino Bardi, Italo Capuzzo-Dolcetta, 2009-05-21 The purpose of the present book is to offer an up to date account of the theory of viscosity solutions of first order partial differential equations of Hamilton Jacobi type and its applications to optimal deterministic control and differential games The theory of viscosity solutions initiated in the early 80's by the papers of M G Crandall and P L Lions CL81 CL83 M G Crandall L C Evans and P L Lions CEL84 and P L Lions influential monograph L82 provides an extremely convenient PDE framework for dealing with the lack of smoothness of the value functions arising in dynamic optimization problems The leading theme of this book is a description of the implementation of the viscosity solutions approach to a number of significant model problems in optimal deterministic control and differential games We have tried to emphasize the advantages offered by this approach in establishing the well posedness of the corresponding Hamilton Jacobi equations and to point out its role when combined with various techniques from optimal control theory and nonsmooth analysis in the important issue of feedback synthesis

Analysis for Applied Mathematics Ward Cheney, 2013-04-17 This book evolved from a course at our university for beginning graduate students in mathematics particularly students who intended to specialize in applied mathematics The content of the course made it attractive to other mathematics students and to graduate students from other disciplines such as engineering physics and computer science Since the course was designed for two semesters duration many topics could be included and dealt with in detail Chapters 1 through 6 reflect roughly the actual nature of the course as it was taught over a number of years The content of the course was dictated by a syllabus governing our preliminary Ph.D. examinations in the subject of applied mathematics That syllabus in turn expressed a consensus of the faculty members involved in the applied mathematics program within our department The text in its present manifestation is my interpretation of that

syllabus my colleagues are blameless for whatever flaws are present and for any inadvertent deviations from the syllabus The book contains two additional chapters having important material not included in the course Chapter 8 on measure and integration is for the benefit of readers who want a concise presentation of that subject and Chapter 7 contains some topics closely allied but peripheral to the principal thrust of the course This arrangement of the material deserves some explanation

Function Spaces and Operators between them José Bonet, David Jornet, Pablo Sevilla-Peris, 2023-10-28 The aim of this work is to present in a unified and reasonably self contained way certain aspects of functional analysis which are needed to treat function spaces whose topology is not derived from a single norm their topological duals and operators between those spaces We treat spaces of continuous analytic and smooth functions as well as sequence spaces Operators of differentiation integration composition multiplication and partial differential operators between those spaces are studied A brief introduction to Laurent Schwartz's theory of distributions and to Lars Hörmander's approach to linear partial differential operators is presented The novelty of our approach lies mainly on two facts First of all we show all these topics together in an accessible way stressing the connection between them Second we keep it always at a level that is accessible to beginners and young researchers Moreover parts of the book might be of interest for researchers in functional analysis and operator theory Our aim is not to build and describe a whole complete theory but to serve as an introduction to some aspects that we believe are interesting We wish to guide any reader that wishes to enter in some of these topics in their first steps Our hope is that they learn interesting aspects of functional analysis and become interested to broaden their knowledge about function and sequence spaces and operators between them The text is addressed to students at a master level or even undergraduate at the last semesters since only knowledge on real and complex analysis is assumed We have intended to be as self contained as possible and wherever an external citation is needed we try to be as precise as we can Our aim is to be an introduction to topics in or connected with different aspects of functional analysis Many of them are in some sense classical but we tried to show a unified direct approach some others are new This is why parts of these lectures might be of some interest even for researchers in related areas of functional analysis or operator theory There is a full chapter about transitive and mean ergodic operators on locally convex spaces This material is new in book form It is a novel approach and can be of interest for researchers in the area

Antenna Synthesis through the Characteristics of Desired Amplitude Mykhalo I. Andriychuk, 2019-09-12 The book is devoted to the synthesis problems that arise in the theory and design of radiating systems antennas The characteristics of desired amplitude are data placed into a synthesis problem A synthesis problem belongs to a class of inverse problems and its aim is to determine a distribution of current or fields in an antenna which produces the amplitude radiation characteristic as close as possible to the desired one Freedom of choice of phase distribution of the desired radiation pattern RP is used as an additional possibility of better approximation to such RPs This book studies various different types of antennas and arrays as the radiation systems under consideration A special class of problems related to acoustic and electromagnetic scattering on a set of bodies particles of small size is also discussed while the constructive procedures of creating inhomogeneous materials with specific properties are proposed
