Functional Thin Films and Nanostructures for Sensors
Anis Zribi, Jeffrey Fortin, 2009-04-05 In recent years there has been a convergence of fundamental materials science and materials processing methods This convergence although highly interdisciplinary in nature has been brought about by technologies such as bandgap engineering and related techniques that have led to application specific devices such as lab on chip and system on a chip The demand for reduced device size device portability and low power dissipation coupled with high speed of operation continues to dictate terms and conditions for the evolution of nanotechnology The present trend in approaches to systems manufacturing continues to focus on integration of mul functionalities on the same chip These functionalities include for example board laser sources sensors and amplifiers Both the military and civilian markets continue to drive the research and development component In recent years the emergency preparedness guidance systems have added excitement and curiosity to this expanding industry The outgrowth of technologies of interest for emergency preparedness includes the development of terahertz sources and detectors and s tems for detection of explosives and concealed weapons among others Sensors made from bulk materials have been around for a long time Enormous advances in

the processing technologies of thin films have led to the ability to manufacture application specific functional thin films

Tribology Issues and Opportunities in MEMS Bharat Bhushan, 2012-12-06 Micro Electro Mechanical Systems MEMS is already about a billion dollars a year industry and is growing rapidly So far major emphasis has been placed on the fabrication processes for various devices There are serious issues related to tribology mechanics surface chemistry and materials science in the operation and manufacturing of many MEMS devices and these issues are preventing an even faster commercialization Very little is understood about tribology and mechanical properties on micro to nanoscales of the materials used in the construction of MEMS devices The MEMS community needs to be exposed to the state of the art of tribology and vice versa Fundamental understanding of friction stiction wear and the role of surface contamination and environmental debris in micro devices is required There are significant adhesion friction and wear issues in manufacturing and actual use facing the MEMS industry Very little is understood about the tribology of bulk silicon and polysilicon films used in the construction of these microdevices These issues are based on surface phenomena and cannot be scaled down linearly and these become increasingly important with the small size of the devices Continuum theory breaks down in the analyses e g in fluid flow of micro scale devices Mechanical properties of polysilicon and other films are not well characterized Roughness optimization can help in tribological improvements Monolayers of lubricants and other materials need to be developed for ultra low friction and near zero wear Hard coatings and ion implantation techniques hold promise
