 Bidawid, Sandra Torriani, 2018-04-26 Advances in next generation sequencing technologies NGS are revolutionizing the field  
 of food microbiology Microbial whole genome sequencing WGS can provide identification characterization and subtyping of  
 pathogens for epidemiological investigations at a level of precision previously not possible This allows for connections and  
 source attribution to be inferred between related isolates that may be overlooked by traditional techniques The archiving and  
 global sharing of genome sequences allow for retrospective analysis of virulence genes antimicrobial resistance markers  
 mobile genetic elements and other novel genes The advent of high throughput 16S rRNA amplicon sequencing in  
 combination with the advantages offered by massively parallel second generation sequencing for metagenomics enable  
 intensive studies on the microbiomes of food products and the impact of foods on the human microbiome These studies may  
 one day lead to the development of reliable culture independent methods for food monitoring and surveillance Similarly RNA  
 seq has provided insights into the transcriptomes and hence the behaviour of bacterial pathogens in food food processing  
 environments and in interaction with the host at a resolution previously not achieved through the use of microarrays and or  
 RT PCR The vast untapped potential applications of NGS along with its rapidly declining costs give this technology the  
 ability to contribute significantly to consumer protection global trade facilitation and increased food safety and security  
 Despite the rapid advances challenges remain How will NGS data be incorporated into our existing global food safety  
 infrastructure How will massive NGS data be stored and shared globally What bioinformatics solutions will be used to  
 analyse and optimise these large data sets This Research Topic discusses recent advances in the field of food microbiology
