Modeling The Acoustic Transfer Function Of A Room

Marc Aretz

Modeling The Acoustic Transfer Function Of A Room:

Combined Wave and Ray Based Room Acoustic Simulations of Small Rooms Marc Aretz, 2012 The present thesis establishes a complete framework for the combination of finite element and classical ray based acoustic simulations in small rooms and discusses the inherent challenges and limitations including all aspects of sound generation sound reflection and sound reception In this context the thesis gives detailed guidelines for the best possible determination of all necessary input data for both simulation domains The overall potential of the presented combined approach is assessed by conducting extensive objective and subjective comparisons of measurement and simulation results for three types of acoustically relevant small spaces a scale model reverberation room a recording studio and two different car passenger compartments

Modeling the Radiation of Modern Sound Reinforcement Systems in High Resolution Stefan Feistel, 2014

Starting from physical theory this work develops a novel framework for the acoustic simulation of sound radiation by loudspeakers and sound reinforcement systems First a theoretical foundation is derived for the accurate description of simple and multi way loudspeakers using an advanced point source CDPS model that incorporates phase data The model's practical implementation is presented including measurement requirements and the GLL loudspeaker data format specification In the second part larger systems are analyzed such as line arrays where the receiver may be located in the near field of the source It is shown that any extended line source can be modeled accurately after decomposition into smaller CDPS elements The influence of production variation among elements of an array is investigated and shown to be small The last part of this work deals with the consequences of fluctuating environmental conditions such as wind and temperature on the coherence of sound signals from multiple sources A new theoretical model is developed that allows predicting the smooth transition from amplitude to power summation as a function of the statistical properties of the environmental parameters A part of this work was distinguished with the AES Publications Award 2010 Parts of the proposed data format have been incorporated into the international AES56 standard

Acoustics of Small Rooms Mendel Kleiner, Jiri

Tichy,2014-04-15 Much time is spent working out how to optimize the acoustics of large rooms such as auditoria but the acoustics of small rooms and environments can be just as vital The expensive sound equipment of a recording studio or the stereo in a car or living room is likewise rendered useless if the acoustic environment is not right for them Changes in wavelength to room size ratio and the time difference between the direct and reflected sound at the listening location mean that the acoustics of small spaces are quite different to those of large spaces Tackling these specific aspects of physics sound perception and applications for small spaces Acoustics of Small Rooms brings together important facets of small room acoustics Divided into clear sections it covers Sound propagation the effects of boundaries sound absorbers and time conditions Physiology and psychoacoustics Methods and techniques of room and sound field optimization Examples of how these principles apply in real situations Measurement and modeling techniques

Uncertainties in Acoustical Transfer Functions Pascal Dietrich,2013 Measured transfer functions of acoustic systems are often used to derive single number parameters The uncertainty analysis is commonly focused on the derived parameters but not on the transfer function as the primary quantity This thesis presents an approach to assess the uncertainty contributions in these transfer functions by using analytic models Uncertainties caused by the measurement method are analyzed with a focus on the underlying signal processing In particular the influence of nonlinearities in the acoustic measurement chain are modeled to predict artifacts in the measured signals and hence the calculated acoustic transfer function Secondly characterization methods commonly applied in the field of signal processing are linked to the acoustic scenarios and the main influencing parameters Acoustic parameters are then derived analytically and by means of Monte Carlo simulations considering the uncertainty of these input parameters In order to provide airborne applications analytic models for sound barrier and room acoustic measurements are developed incorporating the directivity and the orientation of the sound source as well as the positions of sources and receivers The simulated uncertainty contributions are validated by measurements The same approach is also applied to structure borne sound applications

Sound source localization is an important research field that has attracted researchers efforts from many technical and biomedical sciences Sound source localization SSL is defined as the determination of the direction from a receiver but also includes the distance from it Because of the wave nature of sound propagation phenomena such as refraction diffraction diffusion reflection reverberation and interference occur The wide spectrum of sound frequencies that range from infrasounds through acoustic sounds to ultrasounds also introduces difficulties as different spectrum components have different penetration properties through the medium Consequently SSL is a complex computation problem and development of robust sound localization techniques calls for different approaches including multisensor schemes null steering beamforming and time difference arrival techniques The book offers a rich source of valuable material on advances on SSL techniques and their applications that should appeal to researches representing diverse engineering and scientific disciplines

Spatial Sound Bosun Xie,2022-10-17

Proceedings of the EAA Joint Symposium on Auralization and Ambisonics 2014 Weinzierl, Stefan , Vorländer, Michael , Zotter, Franz, Maempel, Hans-Joachim , Lindau, Alexander ,2014
In consideration of the remarkable intensity of research in the field of Virtual Acoustics including different areas such as sound field analysis and synthesis spatial audio technologies and room acoustical modeling and auralization it seemed about time to organize a second international symposium following the model of the first EAA Auralization Symposium initiated in 2009 by the acoustics group of the former Helsinki University of Technology now Aalto University Additionally research communities which are focused on different approaches to sound field synthesis such as Ambisonics or Wave Field Synthesis have in the meantime moved closer together by using increasingly consistent theoretical frameworks Finally the quality of virtual acoustic environments is often considered as a result of all processing stages mentioned above increasing the need for discussions on consistent strategies for evaluation Thus it seemed appropriate to integrate two of the most relevant communities i e to combine the 2nd International Auralization Symposium with the 5th International Symposium on Ambisonics and Spherical Acoustics The Symposia on Ambisonics initiated in 2009 by the Institute of Electronic Music and Acoustics of the University of Music and Performing Arts in Graz were traditionally dedicated to problems of spherical sound field analysis and re synthesis strategies for the exchange of ambisonics encoded audio material and more than other conferences in this area the artistic application of spatial audio systems This publication contains the official conference proceedings It includes 29 manuscripts which have passed a 3 stage peer review with a board of about 70 international reviewers involved in the process Each contribution has already been published individually with a unique DOI on the DepositOnce digital repository of TU Berlin Some conference contributions have been recommended for resubmission to Acta Acustica united with Acustica to possibly appear in a Special Issue on Virtual Acoustics in late 2014 These are not published in this collection
Acoustic Field Analysis in Small Microphone Arrays Roman Scharrer,2013 In this work the possibilities of an acoustic field analysis in small microphone arrays are investigated With the increased use of mobile communication devices such as smartphones and hearing aids and the increase in the number of microphones in such

devices multi channel signal processing has gained popularity Apart from the definite signal processing this thesis evaluates what information on the acoustic sound field and environment can be gained from the signal of such small microphone arrays For this purpose an innovative sound field classification was developed that determines the energies of the single sound field components The method is based on spatial coherences of two or more acoustical The method was successfully verified with a set of simulated and measured input signals An adaptive automatic sensor mismatch compensation was created which proved able to fully compensate any slow sensor drift after an initial training Further a new method for the blind estimation of the reverberation time based on the dependency of the coherence estimate on the evaluation parameters was proposed The method determines the reverberation time of a room from the spatial coherence between two or more acoustic sensors
