

Chapter 14: Gene Expression: From Gene to Protein

- The DNA inherited by an organism leads to specific traits by dictating the synthesis of proteins and of RNA molecules involved in protein synthesis.
 - Proteins are the link between genotype and phenotype
- **Gene expression: process by which DNA directs synthesis of proteins or in some cases, just RNAs**
 - include two stages: transcription and translation

14.1: Genes specify via transcription and translation

- 1902-physician Archibald Garrod first suggested that **genes dictate phenotypes through enzymes**, proteins that catalyze chemical reactions in the cell
 - **Postulated that symptoms of a disease reflect inability to make a particular enzyme**
- Cells synthesize and degrade organic molecules via metabolic pathways that is catalyzed by enzyme

Nutritional Mutants: Scientific Inquiry

- Beadle and Edward Tatum began studying the haploid bread mold *Neurospora crassa*.
 - They studied mutations that altered the ability of the fungus to grow on minimal medium. In order to observe a change in a mutant's phenotype, they needed to disable one allele of a protein-coding gene.
- Beadle and Tatum generated different "nutritional mutants" of *Neurospora* cells, each of which was unable to synthesize a particular essential nutrient.
- One gene-one polypeptide hypothesis: each gene is responsible for the synthesis of a single polypeptide (originally it was enzyme and then protein but it was modified)
- Genes provide instructions for making specific proteins, but RNA is the bridge between DNA and protein synthesis
- Getting from DNA to protein requires two stages:
 - Transcription and translation
- **Transcription:** synthesis of RNA using information in the DNA
 - Transcription produces mRNA
- **Translation:** synthesis of a polypeptide (protein) using information in the mRNA
 - Occurs in ribosome- they facilitate the linking of amino acids into polypeptide chains
- **Bacteria vs eukaryotes:**
 - Flow of genetic information within the cells is different with bacteria because they do not have nuclei. Therefore, nuclear membranes do not separate bacterial

Mathematical and Statistical Methods for Genetic Analysis Kenneth Lange, 2012-12-06 During the past decade geneticists have cloned scores of Mendelian disease genes and constructed a rough draft of the entire human genome The unprecedented insights into human disease and evolution offered by mapping cloning and sequencing will transform medicine and agriculture This revolution depends vitally on the contributions of applied mathematicians statisticians and computer scientists Mathematical and Statistical Methods for Genetic Analysis is written to equip students in the mathematical sciences to understand and model the epidemiological and experimental data encountered in genetics research Mathematical statistical and computational principles relevant to this task are developed hand in hand with applications to population genetics gene mapping risk prediction testing of epidemiological hypotheses molecular evolution and DNA sequence analysis Many specialized topics are covered that are currently accessible only in journal articles This second edition expands the original edition by over 100 pages and includes new material on DNA sequence analysis diffusion processes binding domain identification Bayesian estimation of haplotype frequencies case control association studies the gamete competition model QTL mapping and factor analysis the Lander Green Kruglyak algorithm of pedigree analysis and codon and rate variation models in molecular phylogeny Sprinkled throughout the chapters are many new problems

Applied Probability Kenneth Lange, 2008-01-17 Despite the fears of university mathematics departments mathematics education is growing rather than declining But the truth of the matter is that the increases are occurring outside departments of mathematics Engineers computer scientists physicists chemists economists statisticians biologists and even philosophers teach and learn a great deal of mathematics The teaching is not always terribly rigorous but it tends to be better motivated and better adapted to the needs of students In my own experience teaching students of biostatistics and mathematical biology I attempt to convey both the beauty and utility of probability This is a tall order partially because probability theory has its own vocabulary and habits of thought The axiomatic presentation of advanced probability typically proceeds via measure theory This approach has the advantage of rigor but it inevitably misses most of the interesting applications and many applied scientists rebel against the onslaught of technicalities In the current book I endeavor to achieve a balance between theory and applications in a rather short compass While the combination of brevity and balance sacrifices many of the proofs of a rigorous course it is still cons

tent with supplying students with many of the relevant theoretical tools In my opinion it better to present the mathematical facts without proof rather than omit them altogether
