A First Course in Multivariate Statistics Bernard Flury, 2013-03-09. My goal in writing this book has been to provide teachers and students of multivariate statistics with a unified treatment of both theoretical and practical aspects of this fascinating area. The text is designed for a broad readership, including advanced undergraduate students and graduate students in statistics, graduate students in biology, anthropology, life sciences, and other areas, and postgraduate students. The style of this book reflects my belief that the common distinction between multivariate statistical theory and multivariate methods is artificial and should be abandoned. I hope that readers who are mostly interested in practical applications will find the theory accessible and interesting. Similarly, I hope to show to more mathematically interested students that multivariate statistical modelling is much more than applying

formulas to data sets The text covers mostly parametric models but gives brief introductions to computer intensive methods such as the bootstrap and randomization tests as well The selection of material reflects my own preferences and views My principle in writing this text has been to restrict the presentation to relatively few topics but cover these in detail This should allow the student to study an area deeply enough to feel comfortable with it and to start reading more advanced books or articles on the same topic
