

APPENDIX A: BUILDING VULNERABILITY ASSESSMENT CHECKLIST

The Building Vulnerability Assessment Checklist is based on the checklist developed by the Department of Veterans Affairs (VA) and is part of FEMA #225, *Reference Manual to Mitigate Potential Terrorist Attacks Against Buildings*. This Checklist will help you to prepare your Threat Assessment because it allows a consistent security evaluation of designs at various levels. The Checklist can be used as a screening tool for preliminary design vulnerability assessment and supports the preparation of all steps in this How-To Guide.

The Checklist is organized into 13 sections: 1) site, 2) architectural, 3) structural systems, 4) building envelope, 5) utility systems, 6) mechanical systems, 7) plumbing and gas systems, 8) electrical systems, 9) fire alarm systems, 10) communications and information technology (IT) systems, 11) equipment operations and maintenance, 12) security systems, and 13) security master plan. To conduct a vulnerability assessment of a building or preliminary design, each section of the Checklist should be assigned to an engineer, architect, or subject matter expert who is knowledgeable and qualified to perform an assessment of the assigned area. Each assessor should consider the questions and guidance provided to help identify vulnerabilities and document results in the observations column. If assessing an existing building, vulnerabilities can also be documented with photographs, if possible. The results of the 13 assessments should be integrated into a master vulnerability assessment and provide a basis for determining vulnerability ratings during the assessment process.

Risk Management Series: Incremental Protection for Existing Commercial Buildings from Terrorist Attack Federal Emergency Agency, U. S. Department Security, 2013-01-27 The Federal Emergency Management Agency FEMA developed FEMA 459 Incremental Protection for Existing Commercial Buildings from Terrorist Attack to provide guidance to owners of existing commercial buildings and their architects and engineers on security and operational enhancements to address vulnerabilities to explosive blasts and chemical biological and radiological hazards It also addresses how to integrate these enhancements into the ongoing building maintenance and capital improvement programs These enhancements are intended to mitigate or eliminate long term risk to people and property FEMA s Risk Management Series publications addressing security risks are based on two core documents FEMA 426 Reference Manual to Mitigate Potential Terrorist Attacks Against buildings and FEMA 452 Risk Assessment A How To Guide to Mitigate Potential Terrorist Attacks Against Buildings FEMA 426 provides guidance to the building science community of architects and engineers on reducing physical damage caused by terrorist assaults to buildings related infrastructure and people FEMA 452 outlines methods for identifying the critical assets and functions within buildings determining the potential threats to those assets

and assessing the building's vulnerabilities to those threats. This assessment of risks facilitates hazard mitigation decision making. Specifically, the document addresses methods for reducing physical damage to structural and nonstructural components of buildings and related infrastructure and reducing resultant casualties during conventional bomb attacks as well as attacks involving chemical, biological, and radiological agents. FEMA 459 can be used in conjunction with FEMA 452. This manual presents an integrated incremental rehabilitation approach to implementing the outcomes of a risk assessment completed in accordance with FEMA 452 Risk Assessment A How To Guide to Mitigate Potential Terrorist Attacks Against Building. This approach is intended to minimize disruption to building operations and control costs for existing commercial buildings. The integrated incremental approach to risk reduction in buildings was initially developed in relation to seismic risk and was first articulated in FEMA's Risk Management Series in the widely disseminated FEMA 395 Incremental Seismic Rehabilitation of School Buildings K-12 published in June 2003. In 2004 and 2005, FEMA also published Incremental Seismic Rehabilitation manuals FEMA 396, 400 for hospitals, office buildings, multifamily apartments, retail buildings, and hotels and motels. This manual outlines an approach to incremental security enhancement in four types of existing commercial buildings: office buildings, retail buildings, multifamily apartment buildings, and hotel and motel buildings. It addresses both physical and operational enhancements that reduce building vulnerabilities to blasts and chemical, biological, and radiological attacks within the constraints of the existing site conditions and building configurations.

Primer; to Design Safe School Projects in Case of Terrorist Attacks, 2003. *Reference Manual to Mitigate Potential Terrorist Attacks Against Buildings*. Michael Chipley, 2003. The text provides guidance to the building science community of architects and engineers to reduce physical damage to buildings, related infrastructure, and people caused by terrorist assaults. It presents incremental approaches that can be implemented over time to decrease the vulnerability of buildings to terrorist threats. Many of the recommendations can be implemented quickly and cost effectively. The manual contains many how-to aspects based upon current information contained in Federal Emergency Management Agency (FEMA), Department of Commerce, Department of Defense, Department of Justice, General Services Administration, Department of Veterans Affairs, Centers for Disease Control and Prevention, National Institute for Occupational Safety and Health, and other publications. It describes a threat assessment methodology and presents a Building Vulnerability Assessment Checklist to support the assessment process. It also discusses architectural and engineering design considerations, standoff distances, explosive blast, and chemical, biological, and radiological (CBR) information. The appendices include a glossary of CBR definitions as well as general definitions of key terminologies used in the building science security area. The appendices also describe design considerations for electronic security systems and provide a listing of associations and organizations currently working in the building science security area.

Risk Management Series: Site and Urban Design for Security - Guidance Against Potential Terrorist Attacks. Federal Emergency Agency, U. S. Department Security, 2013-01-27. The Federal Emergency Management Agency

FEMA has developed this publication Site and Urban Design for Security Guidance against Potential Terrorist Attacks to provide information and design concepts for the protection of buildings and occupants from site perimeters to the faces of buildings The intended audience includes the design community of architects landscape architects engineers and other consultants working for private institutions building owners and managers and state and local government officials concerned with site planning and design Immediately after September 11 2001 extensive site security measures were put in place particularly in the two target cities of New York and Washington However many of these security measures were applied on an ad hoc basis with little regard for their impacts on development patterns and community character Property owners government entities and others erected security barriers to limit street access and installed a wide variety of security devices on sidewalks buildings and transportation facilities The short term impacts of these measures were certainly justified in the immediate aftermath of the events of September 11 2001 but traffic patterns pedestrian mobility and the vitality of downtown street life were increasingly jeopardized Hence while the main objective of this manual is to reduce physical damage to buildings and related infrastructure through site design the purpose of FEMA 430 is also to ensure that security design provides careful attention to urban design values by maintaining or even enhancing the site amenities and aesthetic quality in urban and semi urban areas This publication focuses on site design aimed to protect buildings from attackers using vehicles carrying explosives These represent the most serious form of attack Large trucks enable terrorists to carry very large amounts of explosives that are capable of causing casualties and destruction over a range of many hundreds of yards Perimeter barriers and protective design within the site can greatly reduce the possibility of vehicle penetration Introduction of smaller explosive devices carried in suitcases or backpacks must be prevented by pedestrian screening methods Site design for security however may impact the function and amenity of the site and barrier and access control design may impact the quality of the public space within the adjacent neighborhood and community The designer's role is to ensure that public amenity and the aesthetics of the site surroundings are kept in balance with security needs This publication contains a number of examples in which the security amenity balance has been maintained through careful design and collaboration between designers and security experts Much security design work since September 11 2001 has been applied to federal and state projects and these provide many of the design examples shown At present federal government projects are subject to mandatory security guidelines that do not apply to private sector projects but these guidelines provide a valuable information resource in the absence of comparable guidelines or regulations applying to private development Operations and management issues and the detailed design of access control intrusion alarm systems electronic perimeter protection and physical security devices such as locking devices are the province of the security consultant and are not covered here except as they may impact the conceptual design of the site Limited information only is provided on some aspects of chemical biological and radiological CBR attacks that are significant for site designers extensive discussion of approaches to these

threats can be found in FEMA 426 **Incremental Protection for Existing Commercial Buildings from Terrorist Attack: Providing Protection to People and Buildings** , FEMA P 459 Risk Management Series This manual provides building owners and their design consultants with guidance on developing a program of incremental security enhancements that can be implemented over a period of time **Effective Physical Security** Lawrence J. Fennelly, 2013-10-22

Vulnerability assessment and target hardening encompass very important components of the crime and loss prevention field This book written by a collection of specialists in the field contains a wealth of practical immediately useful information Lawrence J Fennelly is an independent security consultant in Cambridge Massachusetts A graduate of the National Crime Prevention Institute Mr Fennelly is a member of the International Society of Crime Prevention Practitioners and the American Society of Industrial Security He is the author of numerous books on security and crime prevention easy reference text written by specialists in the field **Risk Management Series: Safe Rooms and Shelters - Protecting People**

Against Terrorist Attacks Federal Emergency Agency, U. S. Department Security, 2013-01-26 This manual is intended to provide guidance for engineers architects building officials and property owners to design shelters and safe rooms in buildings It presents information about the design and construction of shelters in the work place home or community building that will provide protection in response to manmade hazards The information contained herein will assist in the planning and design of shelters that may be constructed outside or within dwellings or public buildings These safe rooms will protect occupants from a variety of hazards including debris impact accidental or intentional explosive detonation and the accidental or intentional release of a toxic substance into the air Safe rooms may also be designed to protect individuals from assaults and attempted kidnapping which requires design features to resist forced entry and ballistic impact This covers a range of protective options from low cost expedient protection what is commonly referred to as sheltering in place to safe rooms ventilated and pressurized with air purified by ultra high efficiency filters These safe rooms protect against toxic gases vapors and aerosols The contents of this manual supplement the information provided in FEMA 361 Design and Construction Guidance for Community Shelters and FEMA 320 Taking Shelter From the Storm Building a Safe Room Inside Your House In conjunction with FEMA 361 and FEMA 320 this publication can be used for the protection of shelters against natural disasters This guidance focuses on safe rooms as standby systems ones that do not provide protection on a continuous basis To employ a standby system requires warning based on knowledge that a hazardous condition exists or is imminent Protection is initiated as a result of warnings from civil authorities about a release of hazardous materials visible or audible indications of a release e g explosion or fire the odor of a chemical agent or observed symptoms of exposure in people Although there are automatic detectors for chemical agents such detectors are expensive and limited in the number of agents that can be reliably detected Furthermore at this point in time these detectors take too long to identify the agent to be useful in making decisions in response to an attack Similarly an explosive vehicle or suicide bomber attack rarely provides advance

warning therefore the shelter is most likely to be used after the fact to protect occupants until it is safe to evacuate the building Two different types of shelters may be considered for emergency use standalone shelters and internal shelters A standalone shelter is a separate building i e not within or attached to any other building that is designed and constructed to withstand the range of natural and manmade hazards An internal shelter is a specially designed and constructed room or area within or attached to a larger building that is structurally independent of the larger building and is able to withstand the range of natural and manmade hazards Both standalone and internal shelters are intended to provide emergency refuge for occupants of commercial office buildings school buildings hospitals apartment buildings and private homes from the hazards resulting from a wide variety of extreme events The shelters may be used during natural disasters following the warning that an explosive device may be activated the discovery of an explosive device or until safe evacuation is established following the detonation of an explosive device or the release of a toxic substance via an intentional aerosol attack or an industrial accident Standalone community shelters may be constructed in neighborhoods where existing homes lack shelters Community shelters may be intended for use by the occupants of buildings they are constructed within or near or they may be intended for use by the residents of surrounding or nearby neighborhoods or designated areas
