

Transport in Plants

The phloem transports dissolved sugars to the rest of the plant from the leaves.

The xylem transports water and minerals up the plant from water in the soil.

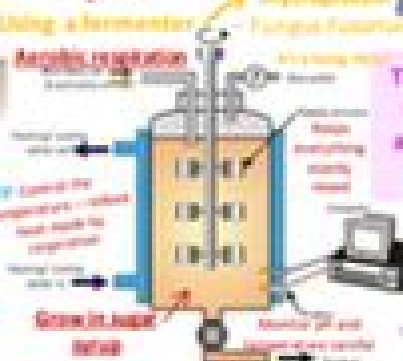

Water moves from the roots to the leaves, up the xylem via the **TRANSPIRATION STREAM**.

Sustainable Food
"producing food in a way that can continue for many years"

Using a fermenter

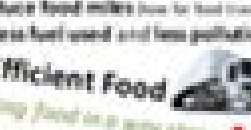

Aerobic respiration

Efficient Food
"producing food in a way that uses energy and resources efficiently"

Energy lost as movement
Energy lost as heat

The way we use the earth's resources can have long and short term effects on the environment.

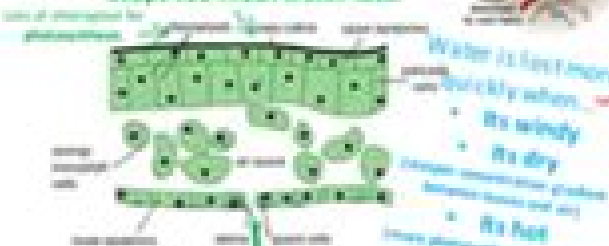

Adaptations for exchange in the intestines (absorbing your food)

Large surface area
Short diffusion pathway
Good blood supply

Waxy cuticle - water and gas proof
Stops too much water loss.

Water is lost more quickly when it's windy or it's dry or it's hot.

Water loss from the leaves is called **TRANSPIRATION**.

Leaves are thin and flat giving them a large surface area for diffusion of gases (CO₂ in and oxygen out).
Guard cells around stomata can open and close to let CO₂ in but stop too much water being lost!

Artificial breathing

Positive pressure - pushing the air in.

Benefits: Not invasive (not a mask) can aid the paralysed for years and can be used during surgery. Can be used at home!

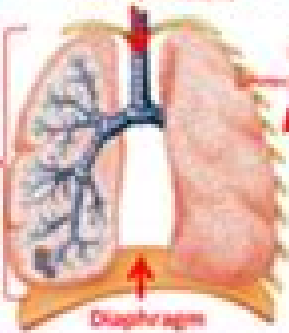

Negative pressure - a vacuum is created outside the body moving the chest up and causing air to be drawn in.

Benefits: Will keep you alive.
Drawbacks: Very restricting and out dated. Must stay in hospital. (not really used anymore)

Lungs

Trachea (windpipe)

Biology Unit 3

Adaptations for gaseous exchange (in your lungs)

Large surface area
Short diffusion pathway
Steep concentration gradient.
Supply and breathing
Alveoli - Air sacs in the lungs
You have loads of these wrapped in capillaries.

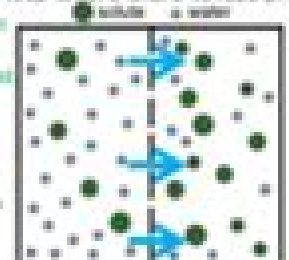

Energy Drinks - for when your **DEHYDRATED**
Contain Water, sugar and mineral ions.
Water - to rehydrate
Sugar - for energy
Minerals - to replace those lost during sweating.

Osmosis

WATER diffusing from where it is a lot of it to where there is less of it.

Through a partially permeable membrane.

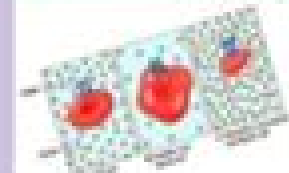

Active Transport

This is when something moves against the concentration gradient. Low to High!

It needs energy to happen! But means ions can be absorbed from soil and sugars and salts can move into cells.

Water moves up a plant stem from cell to cell by osmosis. Lots of water keeps the cell turgid.

Water moves in and out of cell depending on the concentration of the solution surrounding them.

Remember: A more concentrated substance will diffuse into a less water.
