

AP Statistics – Chapter 9 Notes: Testing a Claim

9.1: Significance Test Basics

Null and Alternate Hypotheses

The statement that is being tested is called the **null hypothesis (H_0)**. The significance test is designed to assess the strength of the evidence against the null hypothesis. Usually the null hypothesis is a statement of "no effect," "no difference," or no change from historical values.

The claim about the population that we are trying to find evidence for is called the **alternative hypothesis (H_a)**. Usually the alternate hypothesis is a statement of "an effect," "a difference," or a change from historical values.

Test Statistics

To assess how far the estimate is from the parameter, standardize the estimate. In many common situations, the test statistics has the form

$$\text{test statistic} = \frac{\text{estimate} - \text{parameter}}{\text{standard deviation of the estimate}}$$

P-value

The p-value of a test is the probability that we would get this sample result or one more extreme if the null hypothesis is true. The smaller the p-value is, the stronger the evidence against the null hypothesis provided by the data.

Statistical Significance

If the P-value is as small as or smaller than alpha, we say that the data are statistically significant at level alpha. In general, use $\alpha = 0.05$ unless otherwise noted.

A Plan for Carrying out a Significance Test:

1. *Hypotheses:* State the null and alternate hypotheses
2. *Conditions:* Check conditions for the appropriate test
3. *Calculations:* Compute the test statistic and use it to find the p-value
4. *Interpretation:* Use the p-value to state a conclusion, in context, in a sentence or two

Type I and Type II Errors

There are two types of errors that can be made using inferential techniques. In both cases, we get a sample that suggests we arrive at a given conclusion (either for or against H_0). Sometimes we get a bad sample that doesn't reveal the truth.

Here are the two types of errors:

Type I – Rejecting the H_0 when it is actually **true** (a false positive)

Type II – Accepting the H_0 when it is actually **false** (a false negative)

Be prepared to write, in sentence form, the meaning of a Type I and Type II error in the context of the given situation. The **probability of a Type I error** is the same as alpha, the significance level. You will not be asked to find the probability of a Type II error.

In the past five years the field of electrostatic discharge ESD control has undergone some notable changes Industry standards have multiplied though not all of these in our view are realistic and meaningful Increasing importance has been ascribed to the Charged Device Model CDM versus the Human Body Model HBM as a cause of device damage and presumably premature latent failure Packaging materials have significantly evolved Air ionization techniques have improved and usage has grown Finally and importantly the government has ceased imposing MIL STD 1686 on all new contracts leaving companies on their own to formulate an ESD control policy and write implementing documents All these changes are dealt with in five new chapters and ten new reprinted papers added to this revised edition of ESD from A to Z Also the original chapters have been augmented with new material such as more troubleshooting examples in Chapter 8 and a 20 question multiple choice test for certifying operators in Chapter 9 More than ever the book seeks to provide advice guidance and practical examples not just a jumble of facts and generalizations For instance the added tailored versions of the model specifications for ESD safe handling and packaging are actually in use at medium sized corporations and could serve as patterns for many readers
