Applied Macroeconometrics Carlo A. Favero, 2001 This text provides graduate students of macroeconomics econometrics and monetary economics with discussion and practical illustrations of the techniques used in applied macroeconometrics Until the 1970s there was consensus regarding both the theoretical foundations and the empirical specification of applied macroeconomic modelling commonly known as the Cowles Commission approach This is no longer the case the Cowles Commission approach broke down in the 1970s to be replaced by a number of prominent competing methods the LSE London School of Economics approach the VAR approach and the intertemporal optimization Real Business Cycle approach Applied Macroeconometrics examines the empirical research strategy of these alternatives by interpreting them as attempts to solve the problems observed in the Cowles Commission approach The different research strategies are illustrated with specific reference to real world examples particularly with respect to the monetary transmission mechanism A common US dataset is used in these examples thus allowing the reader easy comparisons The presentation is based on the view that identification a central concept in econometrics provides a natural framework in which to discuss the alternative strategies currently dominating research The first part of the book introduces time series models and details the importance of their identification The second part illustrates chapter by chapter the alternative approaches providing detailed applications of each methodology Data used in the applications are available in a variety of formats from the author's web site and will be supplemented by exercises for the reader to perform

approach to development economics Each section uses data to illustrate key policy issues Part One focuses on the basics of understanding the role of education technology and institutions in determining why incomes differ so much across individuals and countries In Part Two the focus is on techniques to address a number of topics in development including how firms invest how households decide how much to spend on their children s education whether microcredit helps the poor whether food aid works who gets private schooling and whether property rights enhance investment A distinctive feature of the book is its presentation of a range of approaches to studying development questions Development economics has undergone a major change in focus over the last decade with the rise of experimental methods to address development issues this book shows how these methods relate to more traditional ones Please visit the book s website at www.empiricalde.com for online supplements including Stata files and solutions to the exercises

Latent Curve Models Kenneth A. Bollen, Patrick J. Curran, 2006-01-03 An effective technique for data analysis in the social sciences The recent explosion in longitudinal data in the social sciences highlights the need for this timely publication *Latent Curve Models A Structural Equation Perspective* provides an effective technique to analyze latent curve models LCMs This type of data features random intercepts and slopes that permit each case in a sample to have a different trajectory over time Furthermore researchers can include variables to predict the parameters governing these trajectories The authors synthesize a vast amount of research and findings and at the same time provide original results The book analyzes LCMs from the perspective of structural equation models SEMs with latent variables While the authors discuss simple regression based procedures that are useful in the early stages of LCMs most of the presentation uses SEMs as a driving tool This cutting edge work includes some of the authors recent work on the autoregressive latent trajectory model suggests new models for method factors in multiple indicators discusses repeated latent variable models and establishes the identification of a variety of LCMs This text has been thoroughly class tested and makes extensive use of pedagogical tools to aid readers in mastering and applying LCMs quickly and easily to their own data sets Key features include Chapter introductions and summaries that provide a quick overview of highlights Empirical examples provided throughout that allow readers to test their newly found knowledge and discover practical applications Conclusions at the end of each chapter that stress the essential points that readers need to understand for advancement to more sophisticated topics Extensive footnoting that points the way to the primary literature for more information on particular topics With its emphasis on modeling and the use of numerous examples this is an excellent book for graduate courses in latent trajectory models as well as a supplemental text for courses in structural modeling This book is an excellent aid and reference for researchers in quantitative social and behavioral sciences who need to analyze longitudinal data

matured to be part of the standard set of techniques used by statisticians This book is intended to bring these techniques into the class room being we hope a self contained logical development of the subject with all concepts being explained in detail and all theorems etc having detailed proofs There is also an abundance of examples and problems relating the concepts with statistical practice and enhancing primarily the application of simulation techniques to statistical problems of various difficulties This is a textbook intended for a second year graduate course We do not assume that the reader has any familiarity with Monte Carlo techniques such as random variable generation or with any Markov chain theory We do assume that the reader has had a first course in statistical theory at the level of Statistical Inference by Casella and Berger 1990 Unfortunately a few times throughout the book a somewhat more advanced notion is needed We have kept these incidents to a minimum and have posted warnings when they occur While this is a book on simulation whose actual implementation must be processed through a computer no requirement is made on programming skills or computing abilities algorithms are presented in a program like format but in plain text rather than in a specific programming language Most of the examples in the book were actually implemented in C with the S Plus graphical interface
