Approaching Nice With The Egnos System Test Bed:

Satellitenortung und Navigation Werner Mansfeld, 2013-07-01 Die Ortung und die auf ihr beruhende Navigation ist seit dem Altertum eine wesentliche Voraussetzung zur Seefahrt. Sie erfolgte in früheren Zeiten ausschließlich mit optischen Methoden und benutzte die Gestirne als Bezugspunkte. Im 20. Jahrhundert kamen mit den Erfindungen auf dem Gebiet der elektromagnetischen Wellen funktechnische Einrichtungen für die Ortung und Navigation zum Einsatz. Die damit durchgeführte Navigation benötigte keine optische Sicht, war wesentlich einfacher zu handhaben und ging viel schneller. Die weltweit sich stark entwickelnde Luftfahrt verlangte zudem die Bereitstellung von Navigationssystemen, die eine hohe Genauigkeit und große Reichweite gewährleisten. Vor und während des 2. Weltkrieges entstanden für die Navigation in der See und Luftfahrt eine Anzahl von Systemen, die sich auf funktechnische Bodenstationen stützten. Die meisten dieser Systeme fanden nach dem Kriege eine internationale Anwendung. Eine alternative Lösung zur bodengestützten Navigation war die bordautonome Navigation mit Doppler Sensoren und Trägheitssystemen. Mit dem Start des ersten Erdsatelliten Sputnik setzte die Entwicklung von Ortungssystemen ein, bei denen anstelle funktechnischer Einrichtungen in Bodenstationen ganz entsprechende Einrichtungen in Satelliten verwendet wurden. Ursprünglich waren Satellitenortungssysteme für militärische Aufgaben geschaffen worden, jedoch erfolgte im Laufe der Zeit die Freigabe für zivile Zwecke. Mit den Satellitensystemen wurden folgende Vorteile erreicht: Ständige weltweite Nutzbarkeit, relativ geringer Geräteaufwand beim Nutzer und eine hohe von Zeit und Ort unabhängige Genauigkeit der Ortung und damit auch der Navigation. Diese Vorteile führten sehr schnell zu einer Anwendung in allen Bereichen, in denen Positionsbestimmungen erforderlich waren. **Satellite Navigation**

As Symposium Committee Chair for the 2003 International Space University (ISU) Symposium and Editor of this Proceedings volume, respectively, we write this introduction. The success of previous ISU symposia suggests that the ISU has developed a unique and winning formula for a novel type of symposium. The characteristics of ISU symposia are that they adopt a broad and interdisciplinary perspective, address all aspects of the subject ranging from policy, business, organisational and legal issues to technical and scientific topics, foster a constructive dialogue among very different sectors of the space community and allow ample time for interactive discussions. The present Symposium is no exception. It considers the very timely topic of space-based systems for global positioning and navigation, ranging from the GPS system developed by the US military to the Russian GLONASS system and on to the future European Galileo system. Other nations are planning regional augmentation systems.

Symposium on UAVs, Reno, U.S.A. June 8-10, 2009 Kimon P. Valavanis, Randal Beard, Paul Oh, Aníbal Ollero, Leslie A. Piegl, Hayong Shin, 2011-04-11 In the last decade significant changes have occurred in the field of vehicle motion planning and for UAVs in particular UAV motion planning is especially difficult due to several complexities not considered by earlier planning strategies the increased importance of differential constraints atmospheric turbulence which makes it impossible to follow a pre computed plan precisely uncertainty in the vehicle state and limited knowledge about the environment due to limited sensor capabilities These differences have motivated the increased use of feedback and other control engineering techniques for motion planning The lack of exact algorithms for these problems and difficulty inherent in characterizing approximation algorithms makes it impractical to determine algorithm time complexity completeness and even soundness This gap has not yet been addressed by statistical characterization of experimental performance of algorithms and benchmarking Because of this overall lack of knowledge it is difficult to design a guidance system let alone choose the algorithm Throughout this paper we keep in mind some of the general characteristics and requirements pertaining to UAVs A UAV is typically modeled as having velocity and acceleration constraints and potentially the higher order differential constraints associated with the equations of motion and the objective is to guide the vehicle towards a goal through an obstacle field A UAV guidance problem is typically characterized by a three dimensional problem space limited information about the environment on board sensors with limited range speed and acceleration constraints and uncertainty in vehicle state and sensor data
