Sung-Mo Kang, Yusuf Leblebici, 1999      **Analysis and Solutions for Switching Noise Coupling in Mixed-Signal ICs** X. Aragonés, J.L. González, Antonio Rubio, 2013-03-09 Modern microelectronic design is characterized by the integration of full systems on a single die. These systems often include large high performance digital circuitry, high resolution analog parts, high driving I/O and maybe RF sections. Designers of such systems are constantly faced with the challenge to achieve compatibility in electrical characteristics of every section: some circuitry presents fast transients and large consumption spikes whereas others require quiet environments to achieve resolutions well beyond millivolts. Coupling between those sections is usually unavoidable since the entire system shares the same silicon substrate bulk and the same package. Understanding the way coupling is produced and knowing methods to isolate coupled circuitry and how to apply every method is then mandatory knowledge for every IC designer. **Analysis and Solutions for Switching Noise Coupling in Mixed Signal ICs** is an in depth look at coupling through the common silicon substrate and noise at the power supply lines. It explains the elementary knowledge needed to understand these phenomena and presents a review of previous works and new research results. The aim is to provide an understanding of the reasons for these particular ways of coupling, review and suggest solutions to noise coupling and provide criteria to apply noise reduction. **Analysis and Solutions for Switching Noise Coupling in Mixed Signal ICs** is an ideal book both as introductory material to noise coupling problems in mixed signal ICs and for more advanced designers facing this problem.      **Design and Analysis of High Efficiency Line Drivers for xDSL** Tim Piessens, Michiel Steyaert, 2005-12-30 **Design and Analysis of High Efficiency Line Drivers for xDSL** covers the most important building block of an xDSL ADSL VDSL system: the line driver. Traditional Class AB line drivers consume more than 70% of the total power budget of state of the art ADSL modems. This book describes the main difficulties in designing line drivers for xDSL. The most important specifications are elaborated starting from the main properties of the channel and the signal properties. The traditional class AB state of the art class G and future technologies class K are discussed. The main part of **Design and Analysis of High Efficiency Line Drivers for xDSL** describes the design of a novel architecture: the Self Oscillating Power Amplifier or SOPA.      **Building Embedded Systems** Changyi Gu, 2016-05-26 Develop the software and hardware you never think about. We're talking about the nitty gritty behind the buttons on your microwave, inside your thermostat, inside the keyboard used to type this description and even running the monitor on which you are reading it now. **Software Synthesis**

**from Dataflow Graphs** Shuvra S. Bhattacharyya, Praveen K. Murthy, Edward A. Lee, 2012-12-06 Software Synthesis from Dataflow Graphs addresses the problem of generating efficient software implementations from applications specified as synchronous dataflow graphs for programmable digital signal processors DSPs used in embedded real time systems The advent of high speed graphics workstations has made feasible the use of graphical block diagram programming environments by designers of signal processing systems A particular subset of dataflow called Synchronous Dataflow SDF has proven efficient for representing a wide class of unirate and multirate signal processing algorithms and has been used as the basis for numerous DSP block diagram based programming environments such as the Signal Processing Workstation from Cadence Design Systems Inc COSSAP from Synopsys both commercial tools and the Ptolemy environment from the University of California at Berkeley A key property of the SDF model is that static schedules can be determined at compile time This removes the overhead of dynamic scheduling and is thus useful for real time DSP programs where throughput requirements are often severe Another constraint that programmable DSPs for embedded systems have is the limited amount of on chip memory Off chip memory is not only expensive but is also slower and increases the power consumption of the system hence it is imperative that programs fit in the on chip memory whenever possible Software Synthesis from Dataflow Graphs reviews the state of the art in constructing static memory optimal schedules for programs expressed as SDF graphs Code size reduction is obtained by the careful organization of loops in the target code Data buffering is optimized by constructing the loop hierarchy in provably optimal ways for many classes of SDF graphs The central result is a uniprocessor scheduling framework that provably synthesizes the most compact looping structures called single appearance schedules for a certain class of SDF graphs In addition algorithms and heuristics are presented that generate single appearance schedules optimized for data buffering usage Numerous practical examples and extensive experimental data are provided to illustrate the efficacy of these techniques

*Quick-Turnaround ASIC Design in VHDL* N. Bouden-Romdhane, Vijay Madisetti, J.W. Hines, 2012-12-06 From the Foreword Modern digital signal processing applications provide a large challenge to the system designer Algorithms are becoming increasingly complex and yet they must be realized with tight performance constraints Nevertheless these DSP algorithms are often built from many constituent canonical subtasks e g IIR and FIR filters FFTs that can be reused in other subtasks Design is then a problem of composing these core entities into a cohesive whole to provide both the intended functionality and the required performance In order to organize the design process there have been two major approaches The top down approach starts with an abstract concise functional description which can be quickly generated On the other hand the bottom up approach starts from a detailed low level design where performance can be directly assessed but where the requisite design and interface detail take a long time to generate In this book the authors show a way to effectively resolve this tension by retaining the high level conciseness of VHDL while parameterizing it to get good fit to specific applications through reuse of core library components Since they build on a pre designed set of core

elements accurate area speed and power estimates can be percolated to high level design routines which explore the design space Results are impressive and the cost model provided will prove to be very useful Overall the authors have provided an up to date approach doing a good job at getting performance out of high level design The methodology provided makes good use of extant design tools and is realistic in terms of the industrial design process The approach is interesting in its own right but is also of direct utility and it will give the existing DSP CAD tools a highly competitive alternative The techniques described have been developed within ARPAs RASSP Rapid Prototyping of Application Specific SignalProcessors project and should be of great interest there as well as to many industrial designers Professor Jonathan Allen Massachusetts Institute of Technology     *Advanced Concepts in Adaptive Signal Processing* W. Strait,Bernard A. Schnaufer,Xiaohui Li,2012-12-06 Although adaptive filtering and adaptive array processing began with research and development efforts in the late 1950 s and early 1960 s it was not until the publication of the pioneering books by Honig and Messerschmitt in 1984 and Widrow and Stearns in 1985 that the field of adaptive signal processing began to emerge as a distinct discipline in its own right Since 1984 many new books have been published on adaptive signal processing which serve to define what we will refer to throughout this book as conventional adaptive signal processing These books deal primarily with basic architectures and algorithms for adaptive filtering and adaptive array processing with many of them emphasizing practical applications Most of the existing textbooks on adaptive signal processing focus on finite impulse response FIR filter structures that are trained with strategies based on steepest descent optimization or more precisely the least mean square LMS approximation to steepest descent While literally hundreds of archival research papers have been published that deal with more advanced adaptive filtering concepts none of the current books attempt to treat these advanced concepts in a unified framework The goal of this new book is to present a number of important but not so well known topics that currently exist scattered in the research literature The book also documents some new results that have been conceived and developed through research conducted at the University of Illinois during the past five years

*Wireless Technologies* Krzysztof Iniewski,2017-12-19 Advanced concepts for wireless technologies present a vision of technology that is embedded in our surroundings and practically invisible From established radio techniques like GSM 802 11 or Bluetooth to more emerging technologies such as Ultra Wide Band and smart dust motes a common denominator for future progress is the underlying integrated circuit technology Wireless Technologies responds to the explosive growth of standard cellular radios and radically different wireless applications by presenting new architectural and circuit solutions engineers can use to solve modern design problems This reference addresses state of the art CMOS design in the context of emerging wireless applications including 3G 4G cellular telephony wireless sensor networks and wireless medical application Written by top international experts specializing in both the IC industry and academia this carefully edited work uncovers new design opportunities in body area networks medical implants satellite communications automobile radar detection and

wearable electronics The book is divided into three sections wireless system perspectives chip architecture and implementation issues and devices and technologies used to fabricate wireless integrated circuits Contributors address key issues in the development of future silicon based systems such as scale of integration ultra low power dissipation and the integration of heterogeneous circuit design style and processes onto one substrate Wireless sensor network systems are now being applied in critical applications in commerce healthcare and security This reference which contains 25 practical and scientifically rigorous articles provides the knowledge communications engineers need to design innovative methodologies at the circuit and system level
