Gonzalez-Longatt,José Luis Rueda,2014-12-27 This book presents a comprehensive set of guidelines and applications of DIgSILENT PowerFactory an advanced power system simulation software package for different types of power systems studies Written by specialists in the field it combines expertise and years of experience in the use of DIgSILENT PowerFactory with a deep understanding of power systems analysis These complementary approaches therefore provide a fresh perspective on how to model simulate and analyse power systems It presents methodological approaches for modelling of system components including both classical and non conventional devices used in generation transmission and distribution systems discussing relevant assumptions and implications on performance assessment This background is complemented with several guidelines for advanced use of DSL and DPL languages as well as for interfacing with other software packages which is of great value for creating and performing different types of steady state and dynamic performance simulation analysis All employed test case studies are provided as supporting material to the reader to ease recreation of all examples presented in the book as well as to facilitate their use in other cases related to planning and operation studies Providing an invaluable resource for the formal instruction of power system undergraduate postgraduate students this book is also a useful reference for engineers working in power system operation and planning Scientific and Technical Aerospace Reports ,1990 Application of a Bank of Kalman Filters for Aircraft Engine Fault Diagnostics ,2003

In this paper a bank of Kalman filters is applied to aircraft gas turbine engine sensor and actuator fault detection and isolation

FDI in conjunction with the detection of component faults This approach uses multiple Kalman filters each of which is designed for detecting a specific sensor or actuator fault In the event that a fault does occur all filters except the one using the correct hypothesis will produce large estimation errors thereby isolating the specific fault In the meantime a set of parameters that indicate engine component performance is estimated for the detection of abrupt degradation The proposed FDI approach is applied to a nonlinear engine simulation at nominal and aged conditions and the evaluation results for various engine faults at cruise operating conditions are given The ability of the proposed approach to reliably detect and isolate sensor and actuator faults is demonstrated 7 tables 4 figures 17 refs **Energy Research Abstracts** ,1978
