Design of Water Tank, Storage reservoirs and overhead tank are used to store water liquid petroleum petroleum products and similar liquids The force analysis of the reservoirs or tanks is about the same irrespective of the chemical nature of the product All tanks are designed as crack free structures to eliminate any leakage This project gives in brief the theory behind the design of liquid retaining structure circular water tank with flexible and rigid base and rectangular under ground water tank using working stress method This report also includes computer subroutines to analyze and design circular water tank with flexible and rigid base and rectangular under ground water tank The program has been written as Macros in Microsoft Excel using Visual Basic programming language In the end the programs are validated with the results of manual calculation given in Concrete Structure book

Parametric Study and Optimization of Water-tanks Elena Hernando Cánovas, 2014 The study aims to improve the optimization of the resources required to the design and construction of water tanks The criteria and methodology proposed by the standards and studies is analyzed and have

contributed to develop the structural design and the associated parametric study Likewise the methodology applied to develop the environmental analysis Life Cycle Assessment LCA is addressed The present work consists of two studies that has been developed at the same time and which complement each other The structural and the environmental study conducted by an interdisciplinary group from two universities Universitat Aut noma de Catalunya UAB in terms of the environmental study and Universitat Polit cnica de Catalunya UPC for implementing the structural analysis Regarding to the structural part the study carried out consists in analyzing the rectangular and cylindrical reinforced concrete tanks in order to optimize the materials required to meet with the criteria established for its structural design The parametric study was carried out thanks to a program developed in the present work and designed in accordance with the actual codes The program calculates the amounts of materials required for the design and construction of reinforced concrete reservoirs especially the amount of armor to deal with the efforts and the amount of concrete One program for each tank typology has been developed one for the rectangular configuration and another for the cylindrical typology In the environmental analysis the several indicators and the impacts generated by each case structurally analyzed in terms of materials consumption have been studied The LCA plays an important role to provide the criteria in order to choose the optimal configuration between the different solutions Finally general and particular conclusions from the studies developed are presented
