Journal-Bearing Databook Tsuneo Someya,2013-11-11 Journal bearings which are used in all kinds of rotating machinery do not only support static loads such as the weight of rotors and load caused by transmitted torque of reduction gears but are in addition almost the only machine element that is able to suppress various exciting forces acting on the rotating shaft As rotating machines have become large and multi staged while compactness high speed and high output have also been realized in recent years not only has the bearing load increased but also the magnitude and variety of exciting forces Therefore the role and importance of journal bearings have increased tremendously In particular for the design of rotating machines with low vibration levels and high reliability knowledge of the exact characteristic data of bearings and especially of the stiffness or spring coefficients and the damping coefficients of oil films in bearings is essential However the amount of reliable data now applicable to practical design is limited Through the activity of the Research Subcommittee on Dynamic Characteristics of Journal Bearings and Their Applications designated as PSC 28 established and organized in June 1979 through May 1982 within the Japan Society of Mechanical Engineers JSME these coefficients together with static characteristics have been calculated and also measured on a number of new test rigs The Design of Journal Bearings William
