Front End Analysis of Soldier Individual Power Systems Selma Nawrocki, 1993 The 1991 Army Science Board ASB Summer Study on The Soldier as a System identified power as a major barrier to maximizing the soldier's warfighting capabilities Individual Power was identified as an essential component of the Soldier System concept The Front End Analysis FEA of

power conducted 1 May 1991 to 15 March 1992 delineates the requirements constraints for achieving the power levels needed by dismounted soldier The FEA drew upon the achievements and advances in power technology from the Army other services allies and industry to evaluate state of the art technologies and integrate them into a system with synergistic improvement in combat effectiveness The FEA covers primary nonrechargeable and secondary rechargeable batteries fuel cells internal combustion engines Stirling cycle engines vapor and liquid cycle engines and radioactive isotope power sources Several other technologies were examined but were judged not suited for further development They are discussed in the FEA appendices The operating and performance parameters of each technology were evaluated using a computerized parametric model The model results indicate that primary battery driven systems satisfied the short duration 8 hours low energy mission and fuel driven system satisfy longer duration higher energy missions

Mechanics of Materials 2 E.J. Hearn,1997-11-25

One of the most important subjects for any student of engineering or materials to master is the behaviour of materials and structures under load The way in which they react to applied forces the deflections resulting and the stresses and strains set up in the bodies concerned are all vital considerations when designing a mechanical component such that it will not fail under predicted load during its service lifetime Building upon the fundamentals established in the introductory volume *Mechanics of Materials 1* this book extends the scope of material covered into more complex areas such as unsymmetrical bending loading and deflection of struts rings discs cylinders plates diaphragms and thin walled sections There is a new treatment of the Finite Element Method of analysis and more advanced topics such as contact and residual stresses stress concentrations fatigue creep and fracture are also covered Each chapter contains a summary of the essential formulae which are developed in the chapter and a large number of worked examples which progress in level of difficulty as the principles are enlarged upon In addition each chapter concludes with an extensive selection of problems for solution by the student mostly examination questions from professional and academic bodies which are graded according to difficulty and furnished with answers at the end

Internal Combustion Engine in Theory and Practice, second edition, revised, Volume 2 Charles Fayette Taylor,1985-03-19 This revised edition of Taylor s classic work on the internal combustion engine incorporates changes and additions in engine design and control that have been brought on by the world petroleum crisis the subsequent emphasis on fuel economy and the legal restraints on air pollution The fundamentals and the topical organization however remain the same The analytic rather than merely descriptive treatment of actual engine cycles the exhaustive studies of air capacity heat flow friction and the effects of cylinder size and the emphasis on application have been preserved These are the basic qualities that have made Taylor s work indispensable to more than one generation of engineers and designers of internal combustion engines as well as to teachers and graduate students in the fields of power internal combustion engineering and general machine design

Alternatives Robert L. Evans, 2013-06-29 This book contains the proceedings of the International Symposium on Alternative and Advanced Automotive Engines held in Vancouver B C on August 11 and 12 1986 The symposium was sponsored by EXPO 86 and The University of British Columbia and was part of the specialized periods program of EXPO 86 the 1986 world's fair held in Vancouver Some 80 attendees were drawn from 11 countries representing the academic automotive and large engine communities The purpose of the symposium was to provide a critical review of the major alternatives to the internal combustion engine The scope of the symposium was limited to consideration of combustion engines so that electric power for example was not considered This was not a reflection on the possible contribution which electric propulsion may make in the future but rather an attempt to focus the proceedings more sharply than if all possible propulsion systems had been considered In this way all of the contributors were able to participate in the sometimes lively discussion sessions following the presentation of each paper
